

Versal Portfolio Product Overview

Jason Vidmar

System Architect, MILCOM / Satcom / Machine Learning

Mar 14, 2019

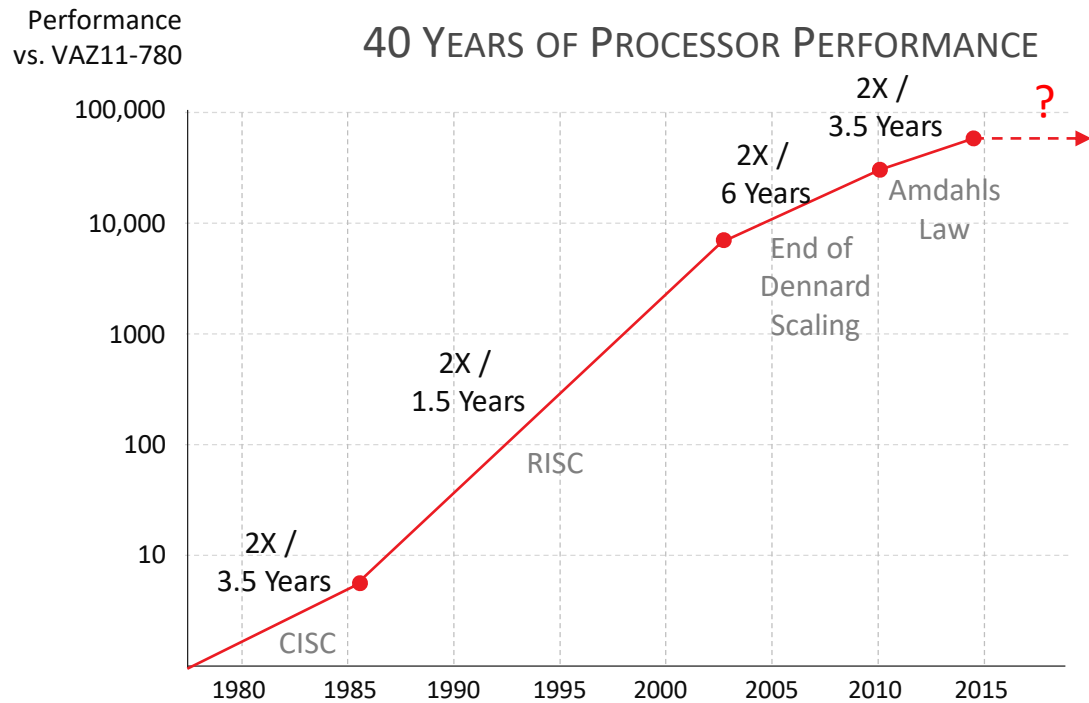

Agenda

- > Introducing Versal: The First ACAP
- > Heterogeneous Acceleration Engines
- > Key Architectural Blocks (Focus on AI Engines)
- > Product Portfolio

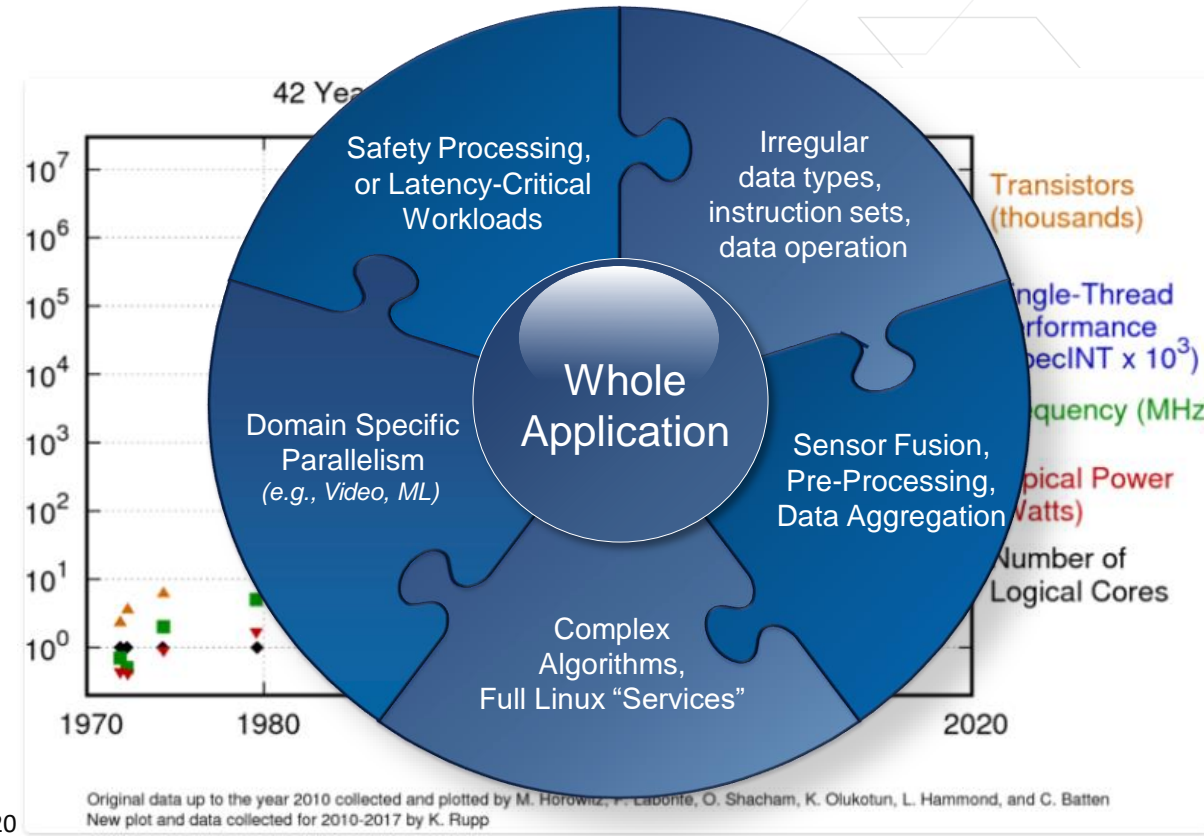

The Technology Conundrum .. And the Need for a New Compute Paradigm

Processing Architectures are Not Scaling

Source: John Hennessy and David Patterson, Computer Architecture: A Quantitative Approach, 6/e 20

A Single Architecture Can't Do It Alone

[WP505](#): “Versal: The First Adaptive Compute Acceleration Platform.”

[WP506](#): “Xilinx AI Engines and Their Applications.”

➤ Disruptive Innovation:

ACAP

Adaptive Compute Acceleration Platform

A new class of devices for today's challenges

Software Programmability

Xilinx Versal (7nm)

AI engines for breakthrough levels of real-time signal processing, including ML inference.

Device Category

New Device Category: Adaptive Compute Acceleration Platform

COMPUTE ACCELERATION

ADAPTIVE

Diverse Workloads in Milliseconds

Future-Proof for New Algorithms

PLATFORM

Development Tools
HW/SW Libraries
Run-time Stack

SW Programmable
Silicon Infrastructure

Enabling Data Scientists, SW Developers, HW Developers

Breakthrough Performance for Cloud, Network, and Edge

Cloud Compute
Breakthrough AI Inference

Networking
Multi-terabit Throughput

5G Wireless
Compute for Massive MIMO

Edge Compute
AI Inference at Low Power

>> 7

Versal Architecture Overview

Adaptable Engines
2X compute density

Scalar Engines

- Platform Control
- Edge Compute

Protocol Engines

- Integrated 600G cores
- 4X encrypted bandwidth

Programmable I/O

- Any interface or sensor
- Includes 3.2Gb/s MIPI

Transceivers

- Broad range, 25G → 112G
- 58G in mainstream devices

PCIe & CCIX

- 2X PCIe & DMA bandwidth
- Cache-coherent interface to accelerators

Intelligent Engines

- AI Compute
- Diverse DSP workloads

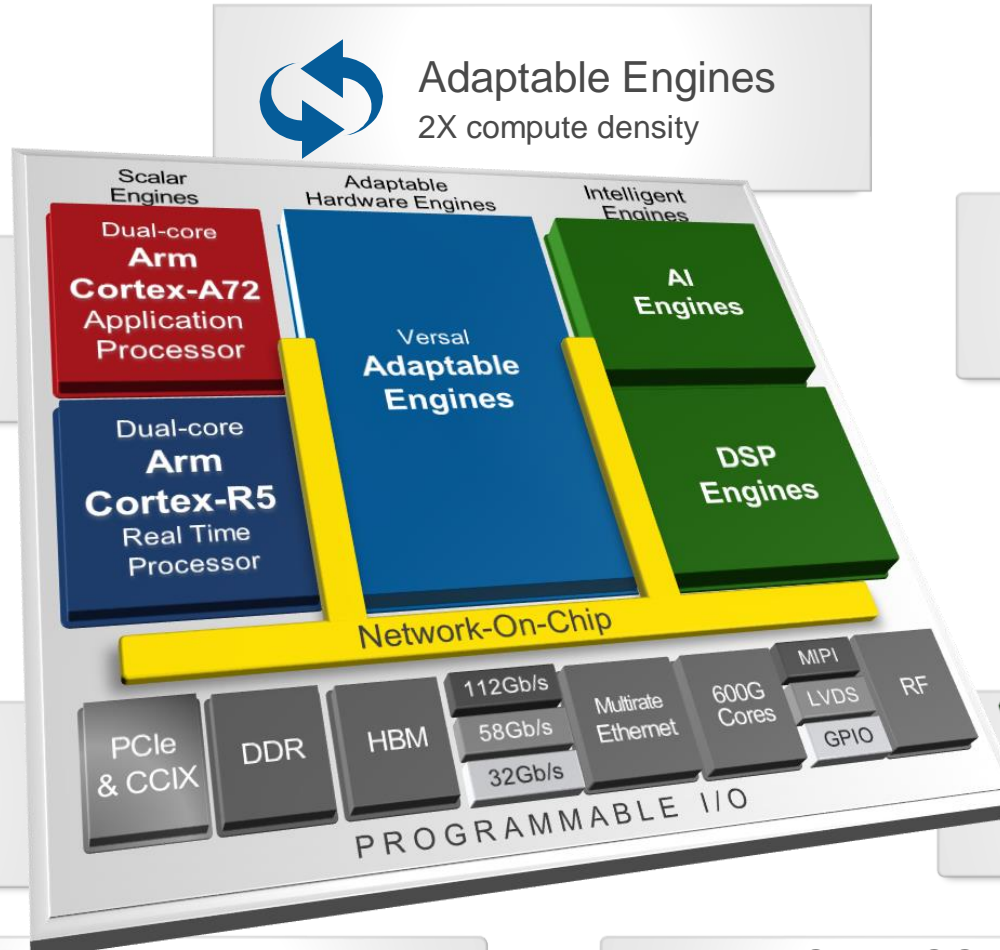

Network-on-Chip

- Guaranteed Bandwidth
- Enables SW Programmability

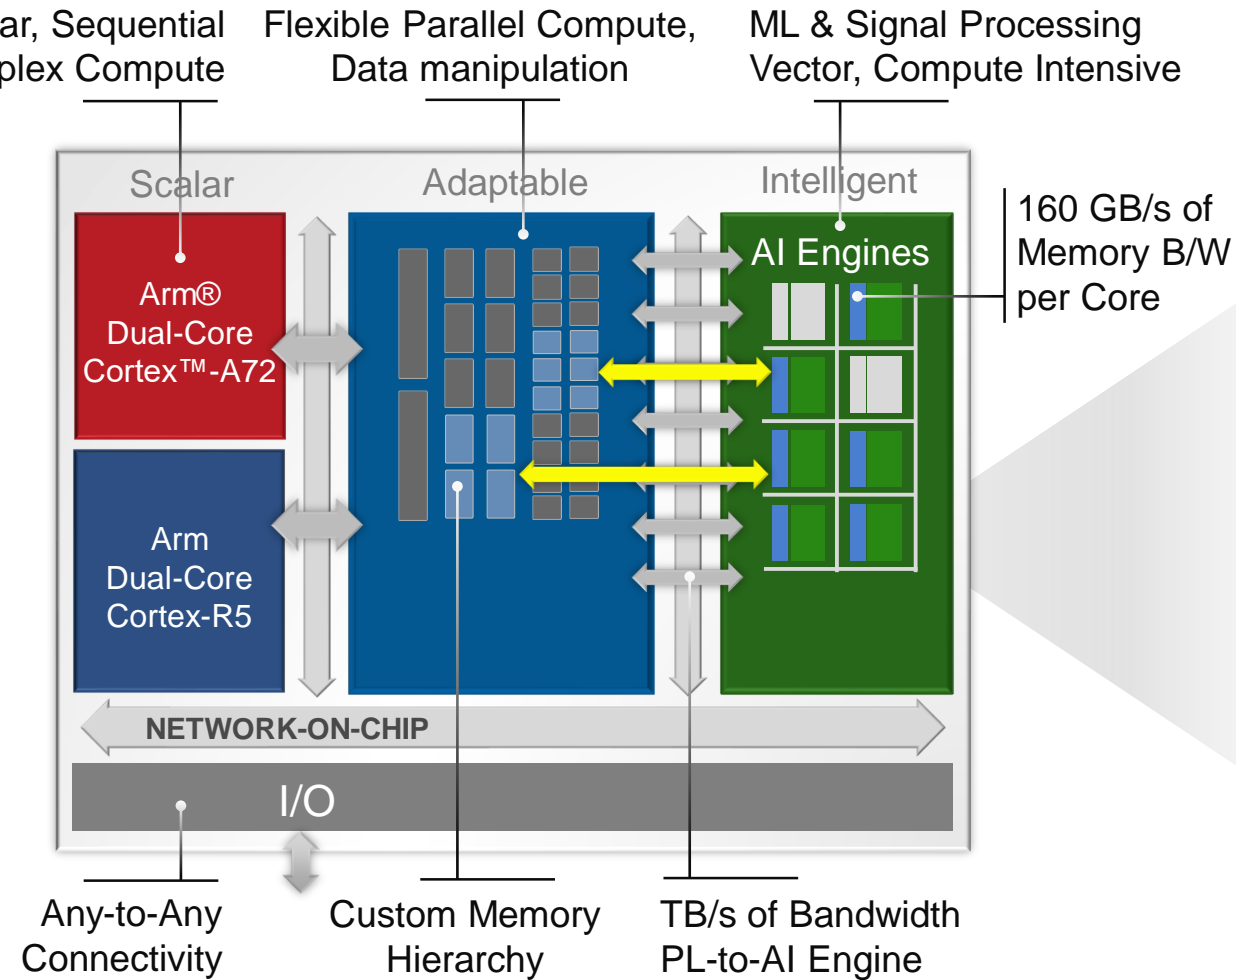

DDR Memory

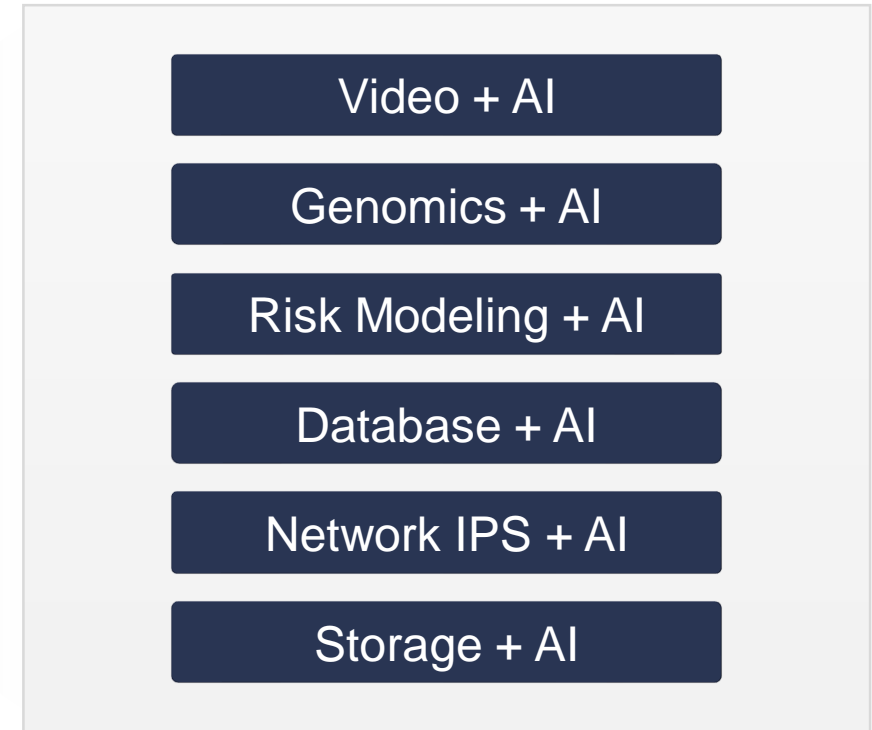

- 3200-DDR4, 4266-LPDDR4
- 2X bandwidth/pin

Hardware Adaptable: Accelerating the Whole Application

Heterogeneous Acceleration from Data Center to the Edge

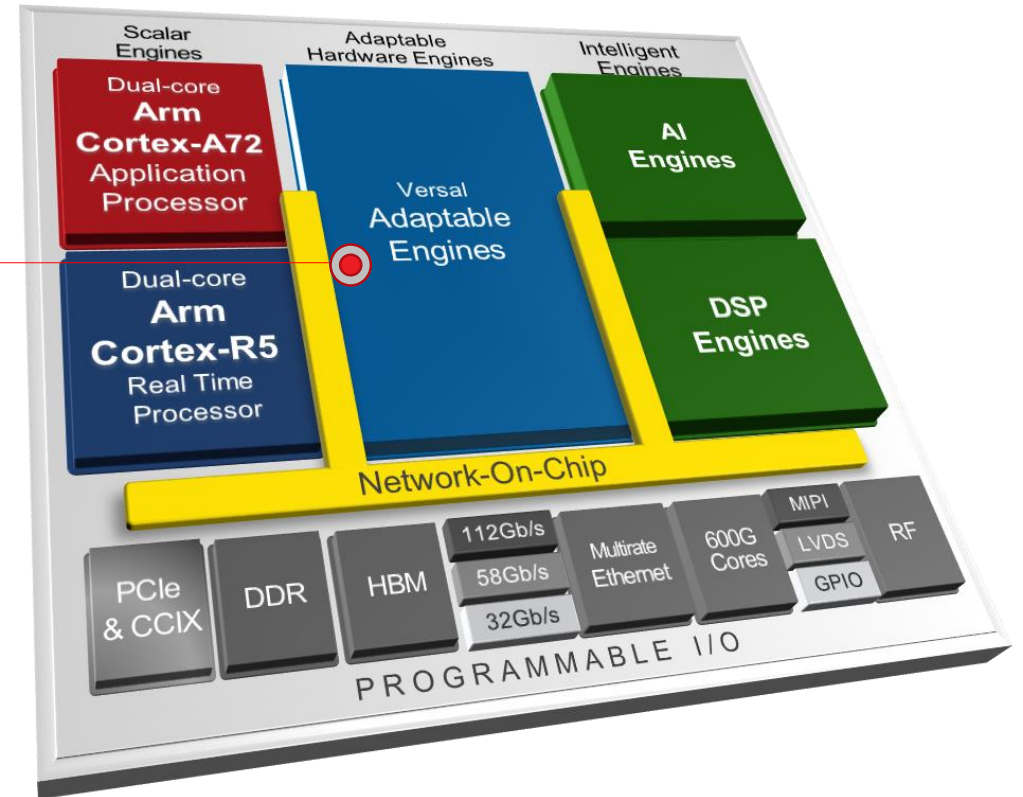

Adaptable Engines

Adaptable Hardware Engines

Programmable logic for fine-grained parallel processing, data aggregation, and sensor fusion

Programmable memory hierarchy to optimize compute efficiency

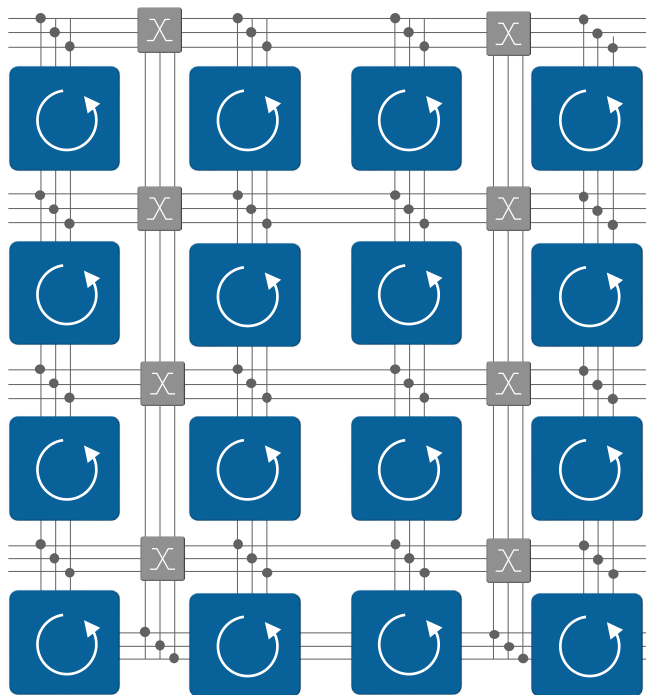

High bandwidth, low latency data movement between engines and I/O

Adaptable Engines: Greater Compute Density for Any Workload

Re-Architected Hardware Fabric

- > 4X density per logic block for more compute
- > Less external routing → greater performance
- > Code and IP compatible with 16nm devices

Tune for Power & Performance

- > Three operating voltages to choose from
- > Balance power/performance for target app
- > Equivalent to 3 speed grades in one device

Adaptable to any Workload

- > Bit-level precision (1 → 1,000) for any algorithm
- > Improves ML efficiency (compression, pruning)
- > Forward-compatible to lower precision neural networks, e.g., BNN

ML Inference and Optimizations (e.g., pruning)

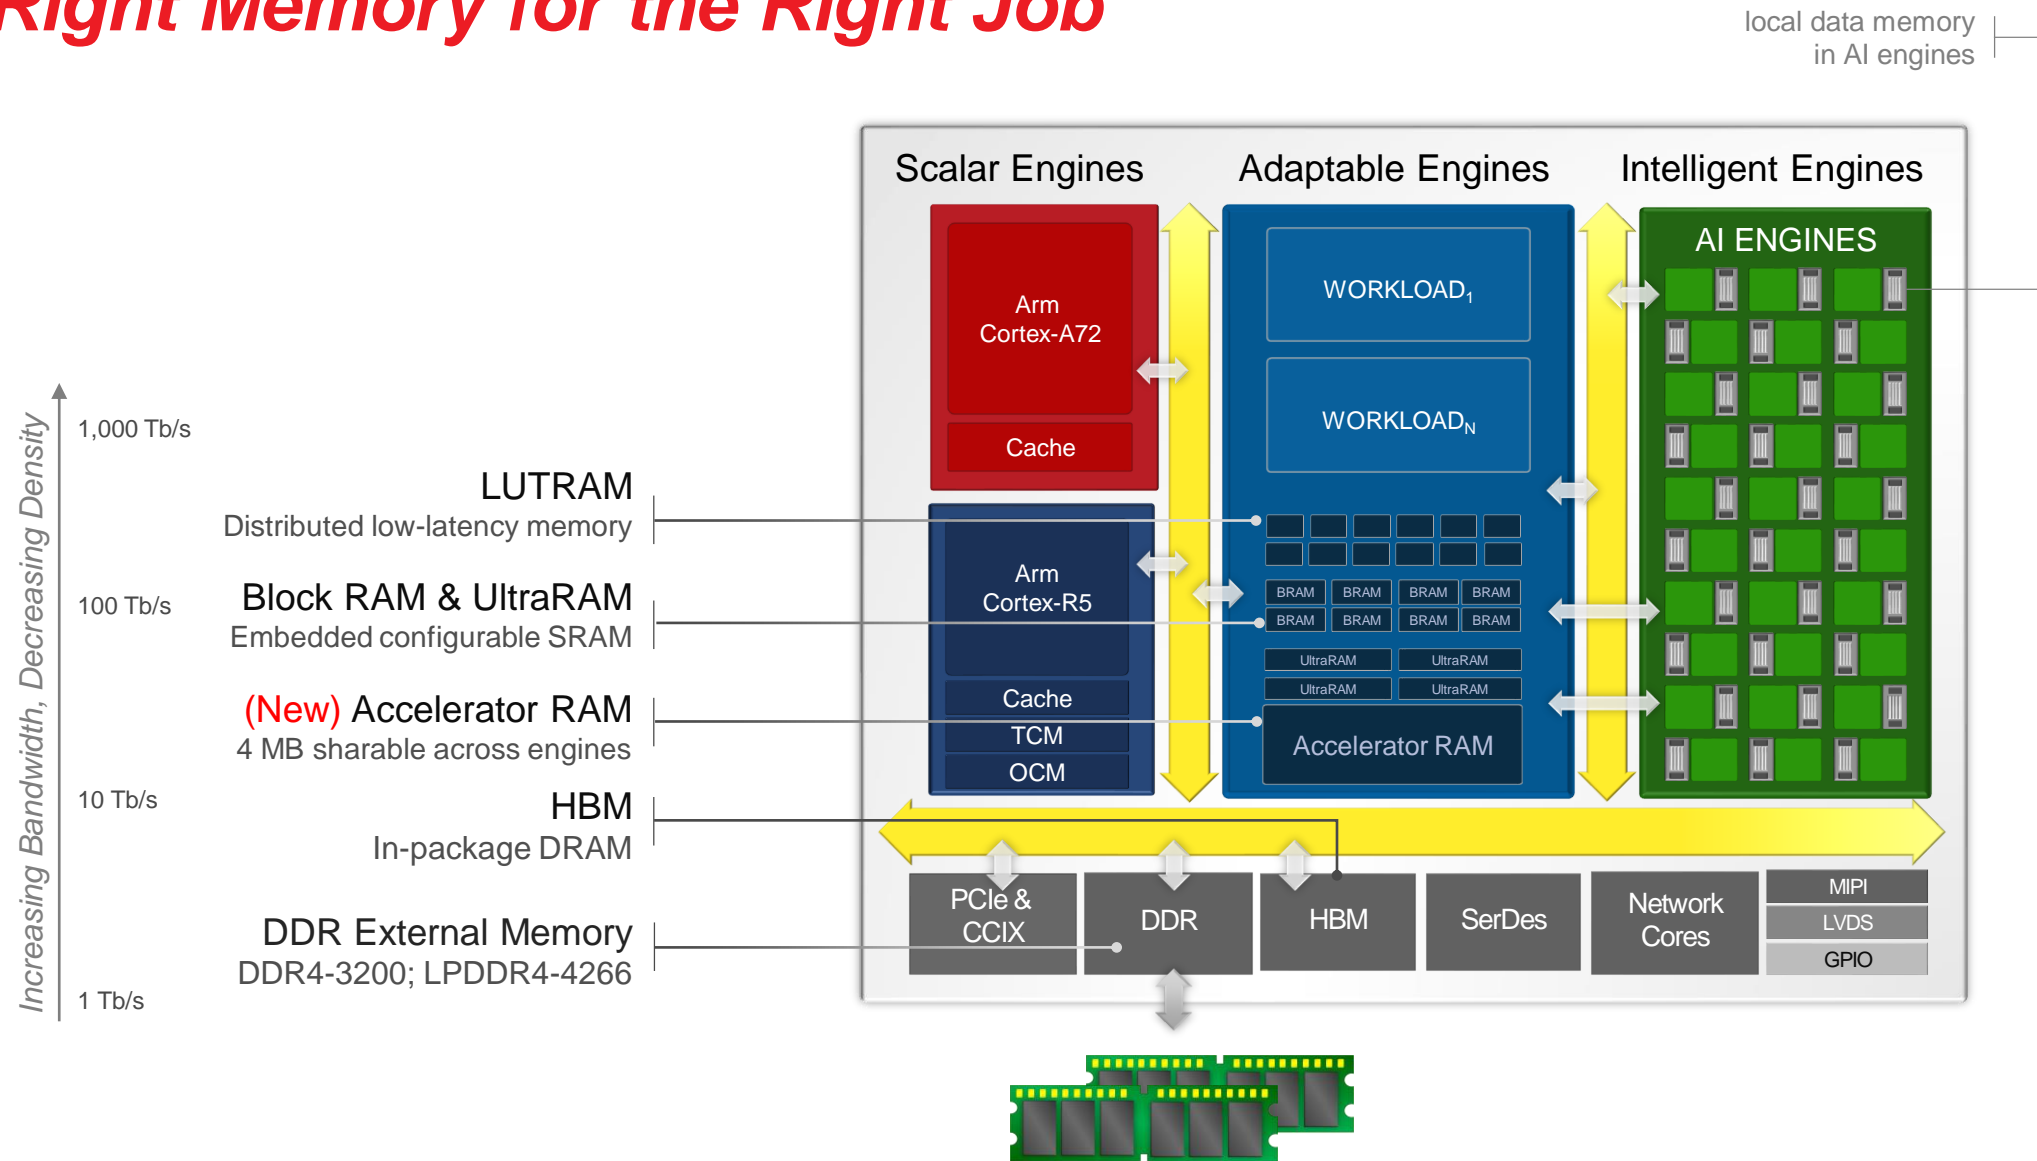

For Any Workload, e.g., ...

Adaptable Memory Hierarchy

The Right Memory for the Right Job

Intelligent Engines

Intelligent Engines for Diverse Compute

DSP Engines

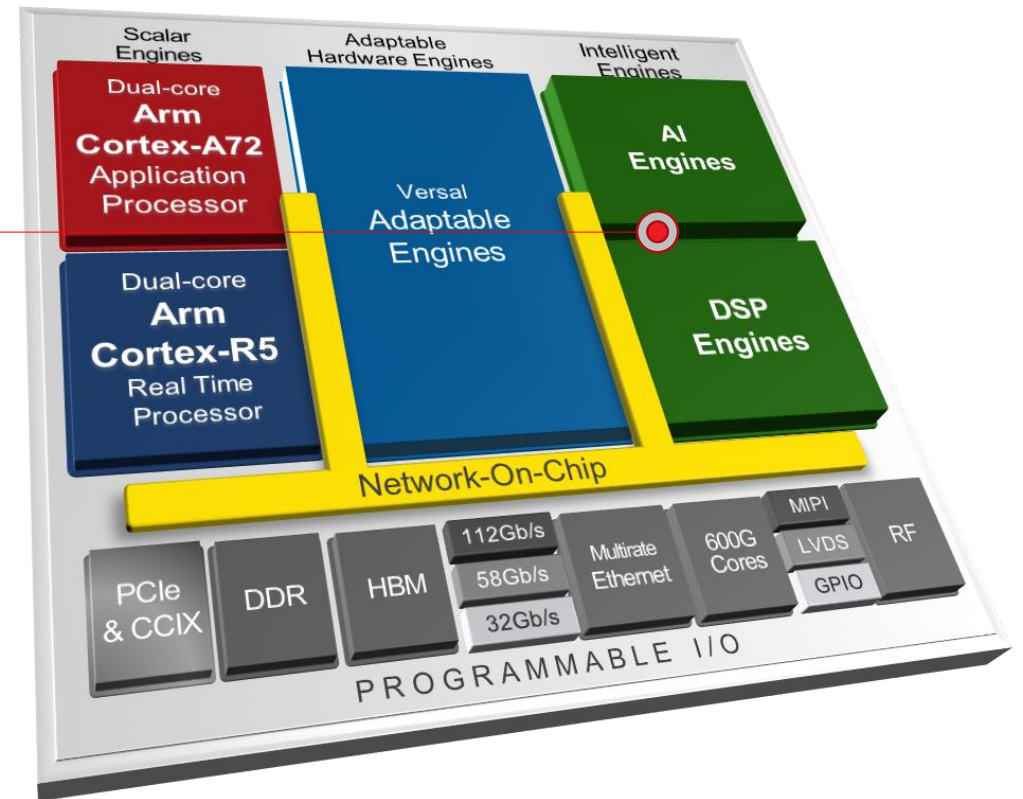

High-precision floating point & low latency

Granular control for customized data paths

AI Engines

High throughput, low latency, and power efficient

Ideal for AI inference and advanced signal processing

Intelligent Engines: Digital Signal Processing Capability

Function	DSP48E2	DSP58
DSP Tile/Slice Type	DSP48E2	DSP58
Multiplier and MACC	27x18	27x24
32b/16b Single Precision Floating Point Multiply-Add	Soft	✓
Complex 18b x Complex 18b	N/A	2 x DSP58
3 x Int8 Dot Product	N/A	✓

AI Engine 2D Array

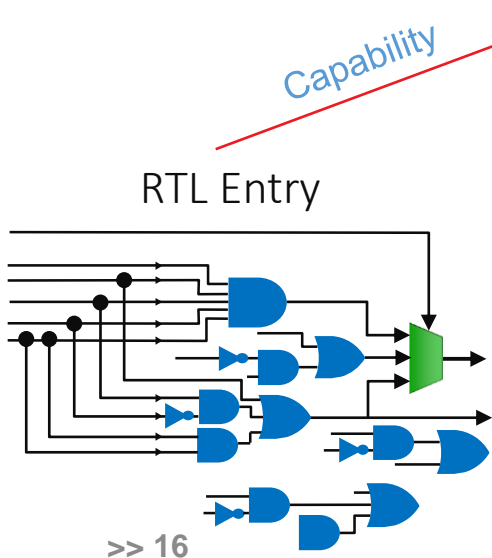

VLIW and SIMD Architecture

C/C++ Programmable

FPGA Fabric DSP

LUT and Memory

DSP48E2 Slice

Hardened MULT & ADDERS
ACC = ACC + (A × B)

RTL Entry

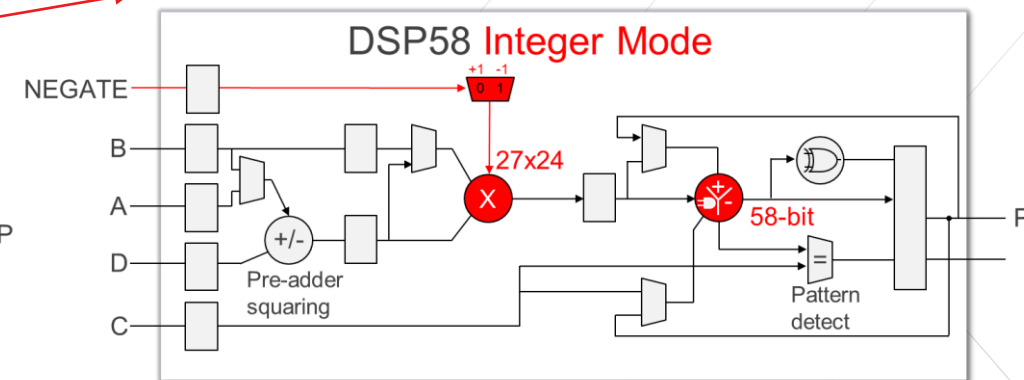

Capability

Capability

DSP58

Additional features

RTL Entry

NoC for Ease of Use, Guaranteed Bandwidth, and Power Efficiency

High bandwidth terabit network-on-chip

- > Memory mapped access to all resources
- > Built-in arbitration between engines and memory

High Bandwidth, Low Latency, Low power

- > Guaranteed QoS
- > 8X power efficiency vs. FPGA implementations

Eases Kernel Placement

- > Easily swap kernels at NoC port boundaries
- > Simplifies connectivity between kernels

Introducing the “Integrated Shell”

‘Shell’: Pre-Built Core Infrastructure & System Connectivity

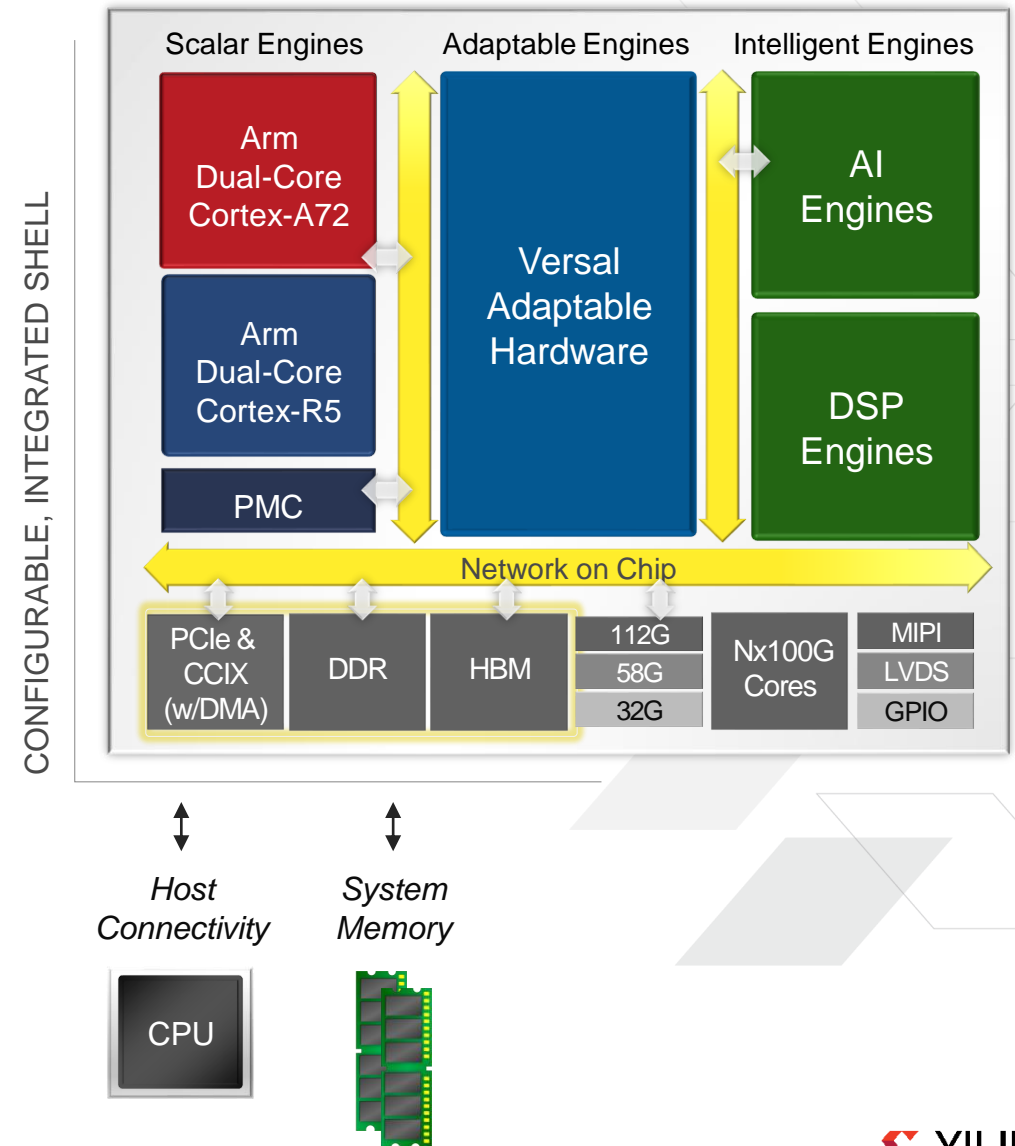

- > External host interface
- > Memory subsystem
- > Basic interfaces (e.g., JTAG, USB, GbE)

Key Architectural Elements of the Shell

- > Platform Management Controller (PMC)
- > Integrated host interfaces: PCIe & CCIX, DMA
- > Scalable Memory Subsystem: DDR4 & LPRDDR4
- > Network-on-Chip for connectivity and arbitration

Greater Performance, Device Utilization, and Productivity

- > More of the platform available for application’s workload(s)
- > Target application runs faster with less device congestion
- > Turn-key, pre-engineered timing closure – no debug

AI Engines

AI Engines

Massive AI Inference Throughput and Wireless Compute

1.3GHz VLIW / SIMD vector processors

- > Versatile core for ML and other advanced DSP workloads

Massive array of interconnected cores

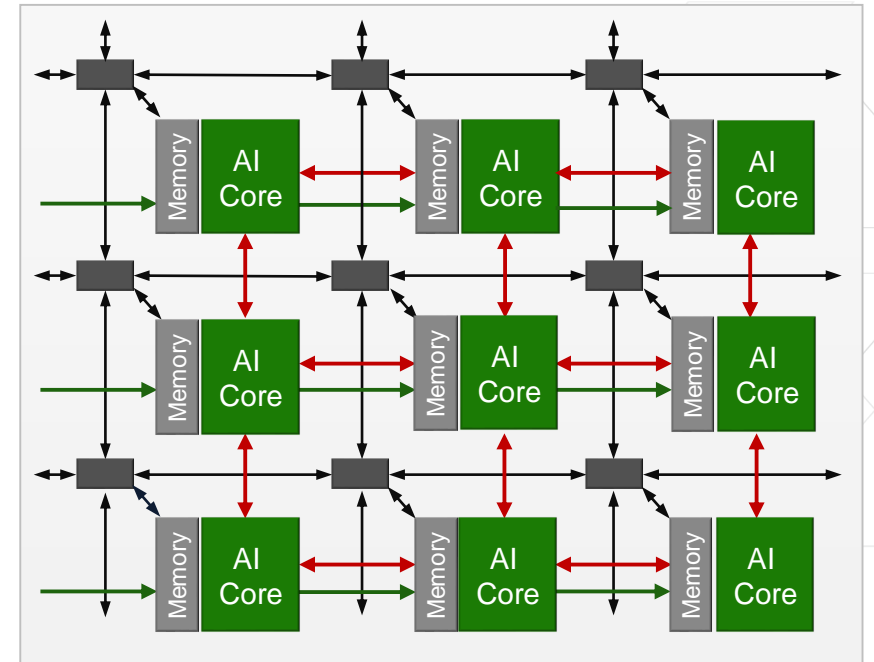

- > Instantiate multiple tiles (10s to 100s) for scalable compute

Terabytes/sec of interface bandwidth to other engines

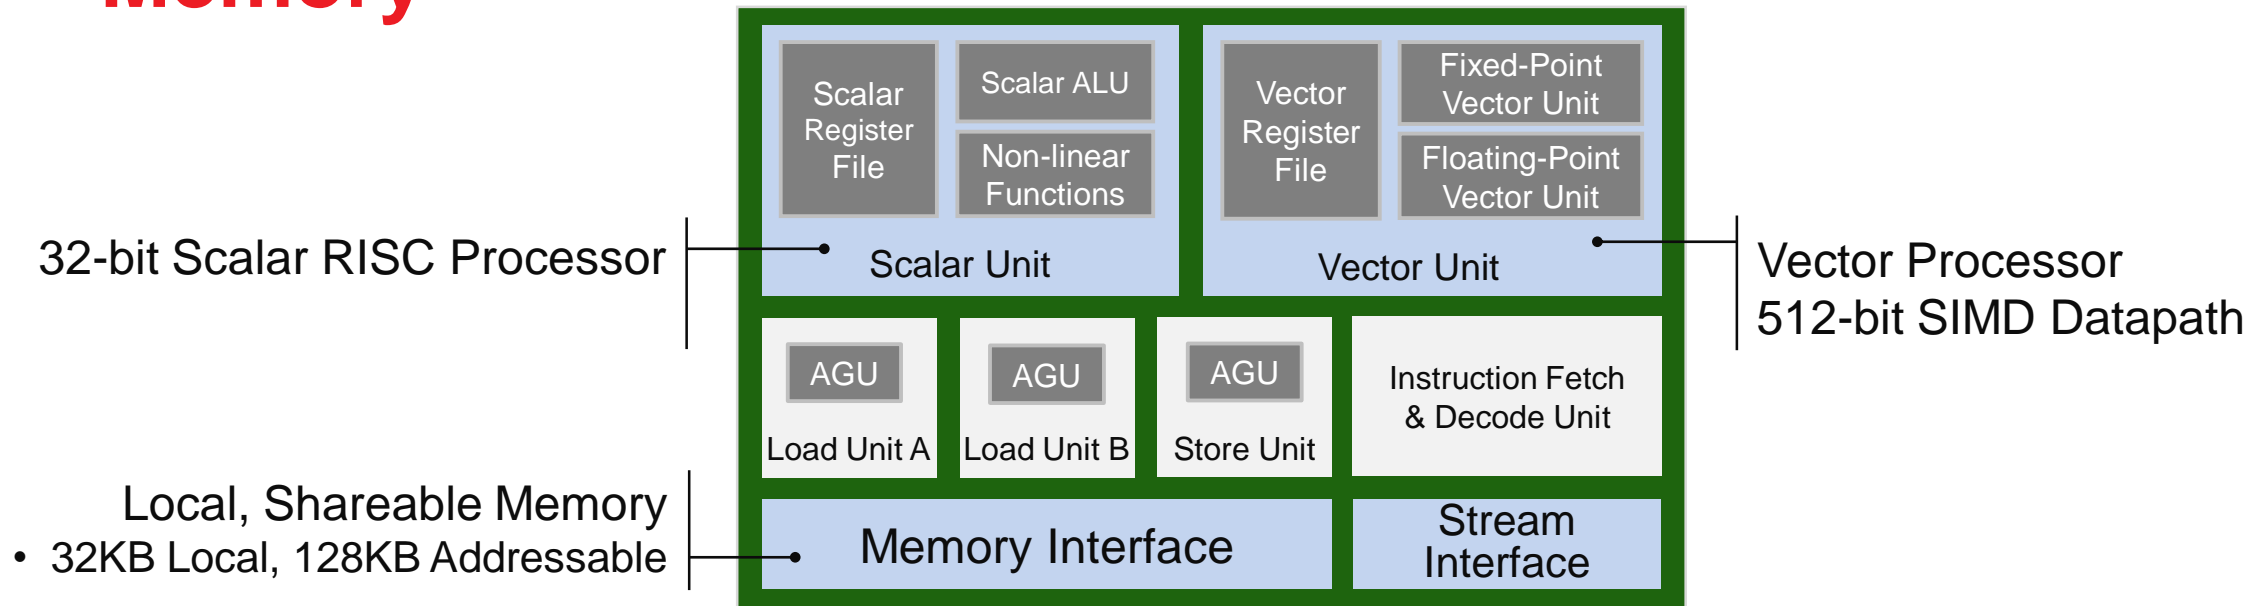

- > Direct, massive throughput to adaptable HW engines
- > Implement core application with AI for “Whole App Acceleration”

SW programmable for any developer

- > C programmable, compile in minutes
- > Library-based design for ML framework developers

AI Engine: Scalar Unit, Vector Unit, Load Units and Memory

Instruction Parallelism: VLIW

7+ operations / clock cycle

- 2 Vector Loads / 1 Mult / 1 Store
- 2 Scalar Ops / Stream Access

Highly Parallel

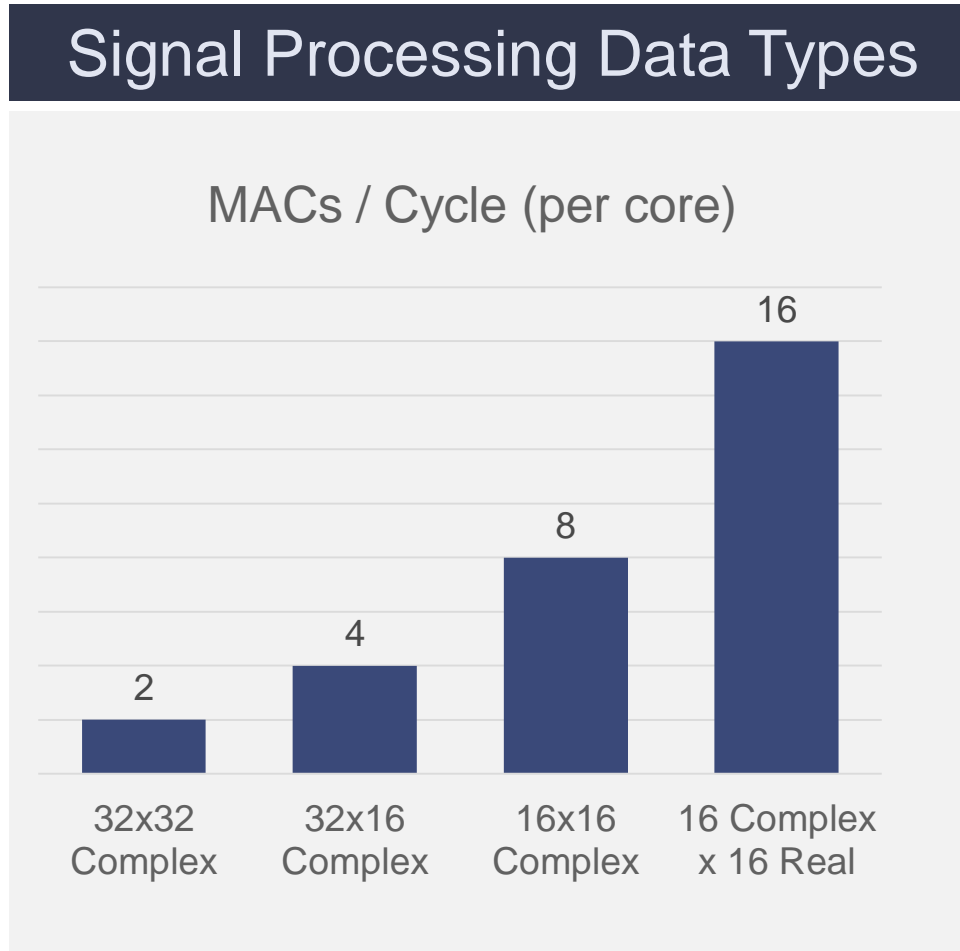

Data Parallelism: SIMD

Multiple vector lanes

- Vector Datapath
- 8 / 16 / 32-bit & SPFP operands

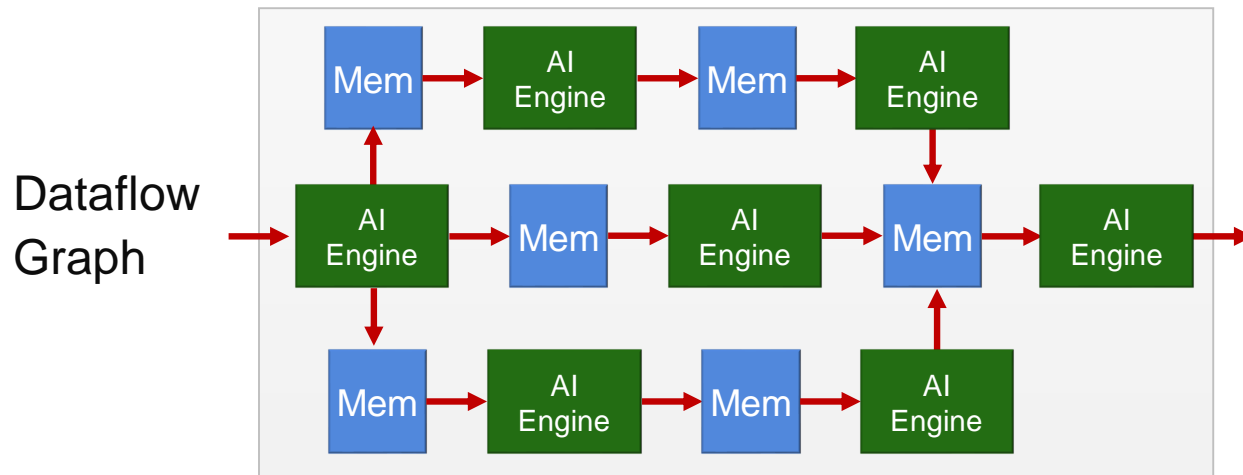

Up to 128 MACs / Clock Cycle per Core (INT 8)

Multi-Precision Support

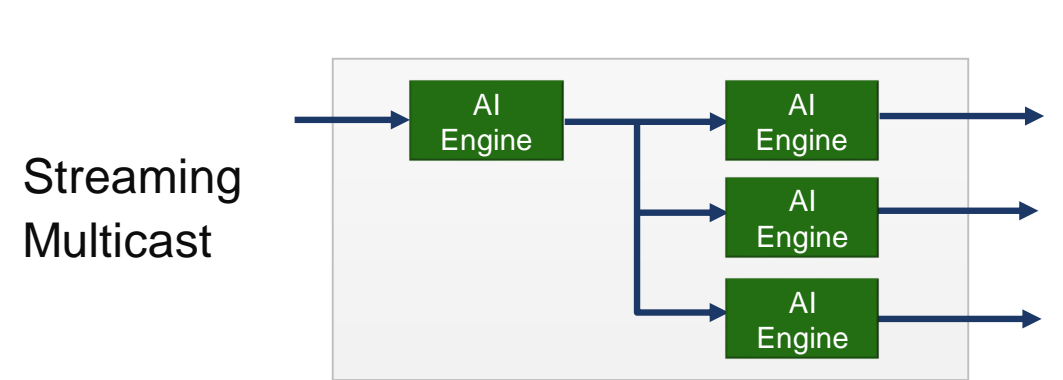

Data Movement Architecture

Memory Communication (neighbor)

Streaming Communication (non-neighbor)

- Memory Interface
- Stream Interface
- Cascade Interface

AI Engine Integration with Versal™ ACAP

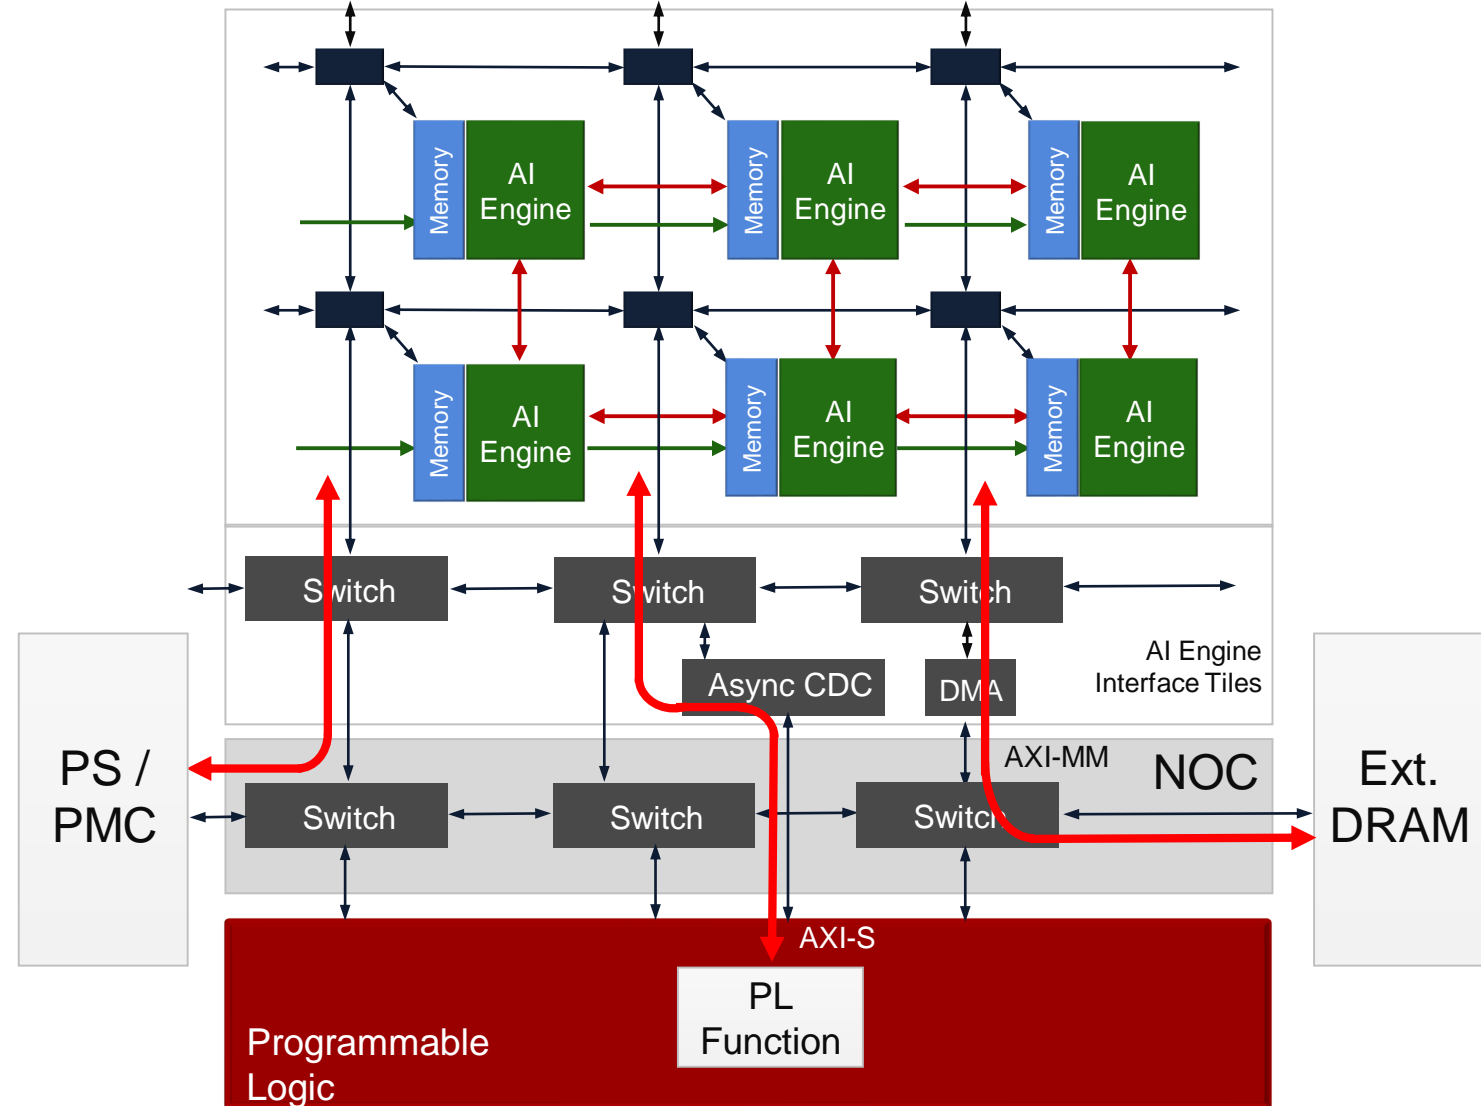

> TB/s of Interface Bandwidth

- >> AI Engine to Programmable Logic
- >> AI Engine to NOC

> Leveraging NOC connectivity

- >> PS manages Config / Debug / Trace
- >> AI Engine to DRAM (no PL req'd)

AI Engine Delivers High Compute Efficiency

> Adaptable, non-blocking interconnect

- >> Flexible data movement architecture
- >> Avoids interconnect “bottlenecks”

> Adaptable memory hierarchy

- >> Local, distributed, shareable = extreme bandwidth
- >> No cache misses or data replication
- >> Extend to PL memory (BRAM, URAM)

> Transfer data while AI Engine Computes

Overlap Compute and Communication

Vector Processor Efficiency

ML Convolutions

Block-based Matrix Multiplication (32x64) x (64x32)

FFT

1024-pt FFT/iFFT

DPD

Volterra-based forward-path DPD

AI Inference on Versal™ ACAP

Convolutions

Fully Connected Layers

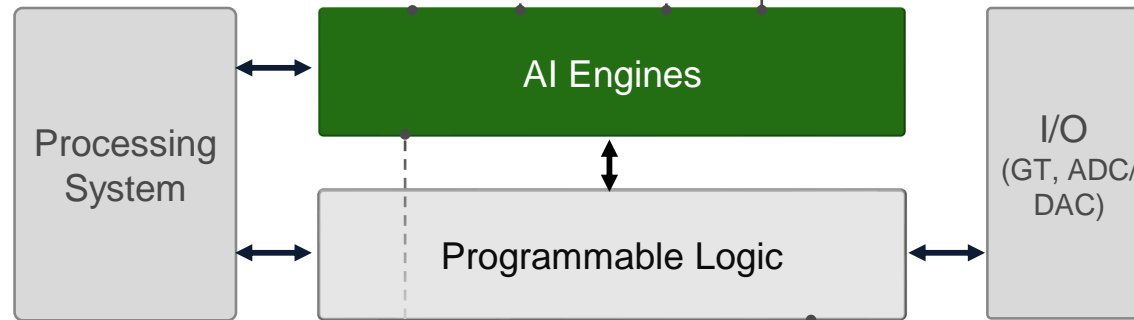

Pooling

Activations

- Video
- Genomics
- Storage
- Database
- Network IPS
- Risk modeling

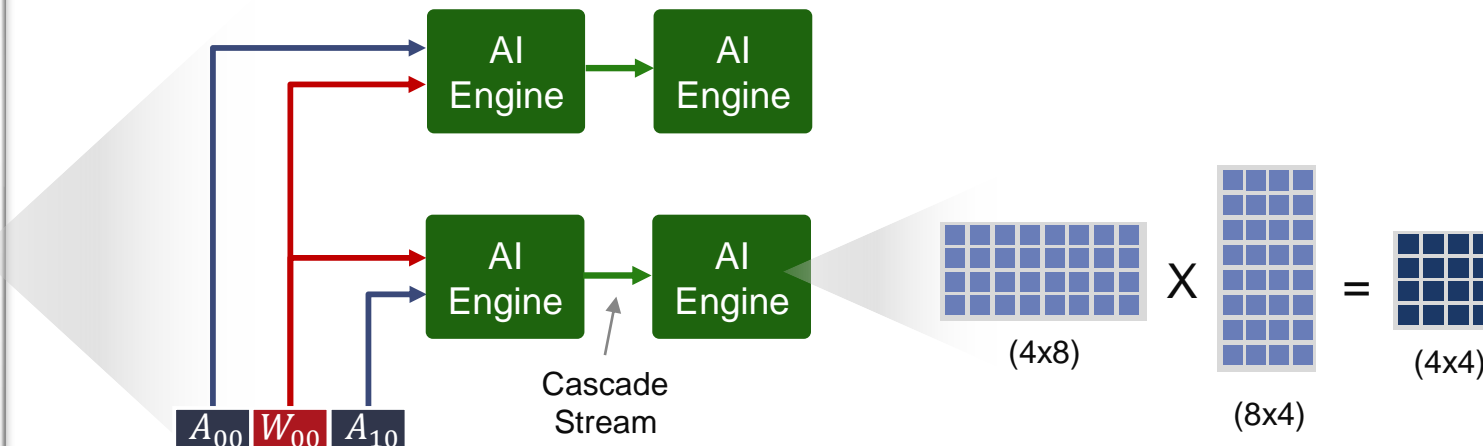

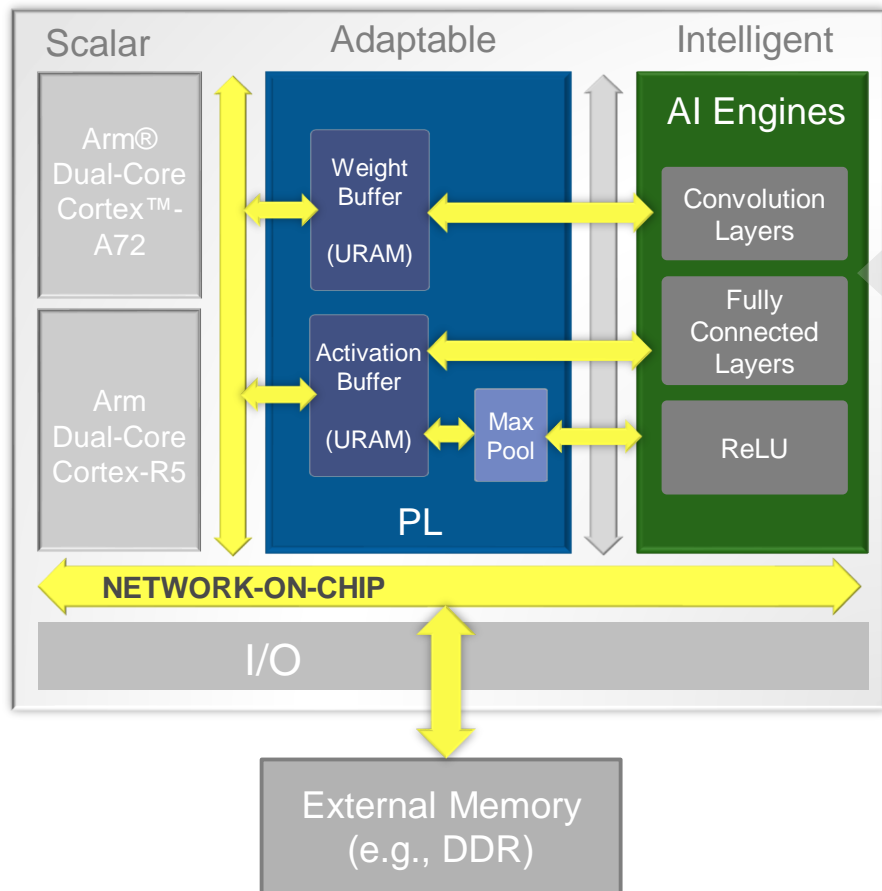

Custom Memory Hierarchy

*Figure credit: https://en.wikipedia.org/wiki/Convolutional_neural_network

AI Inference Mapping on Versal™ ACAP

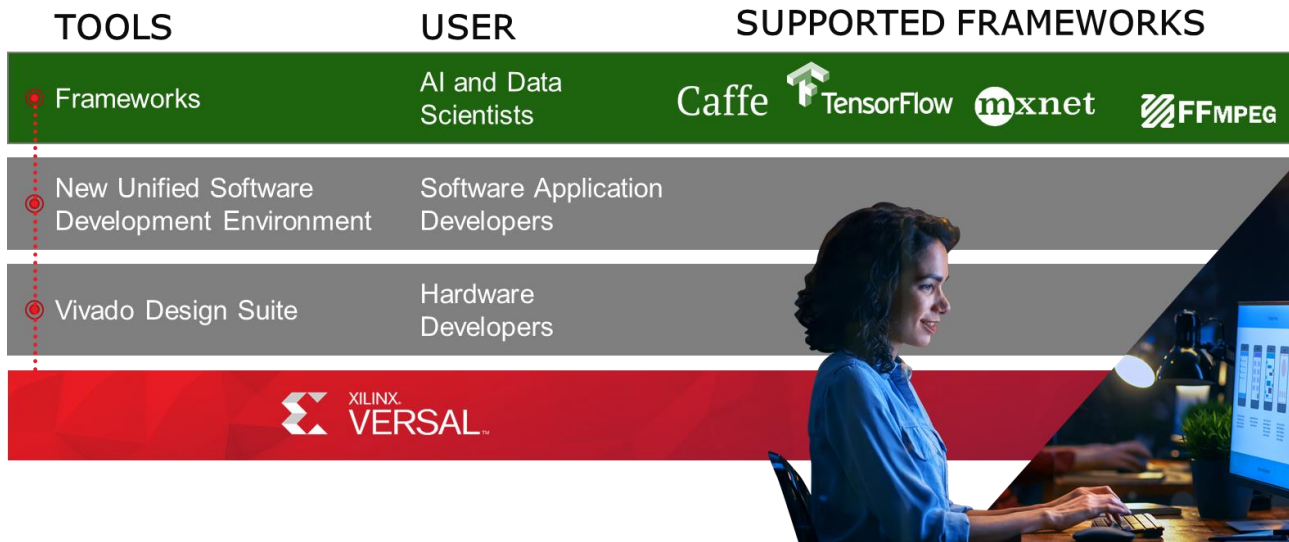

A = Activations
W = Weights

$$\begin{bmatrix} A_{00} & A_{01} \\ A_{10} & A_{11} \end{bmatrix} \times \begin{bmatrix} W_{00} & W_{01} \\ W_{10} & W_{11} \end{bmatrix} = \begin{bmatrix} A_{00} \times W_{00} + A_{01} \times W_{10} & \dots \\ A_{10} \times W_{00} + A_{11} \times W_{10} & \dots \end{bmatrix}$$

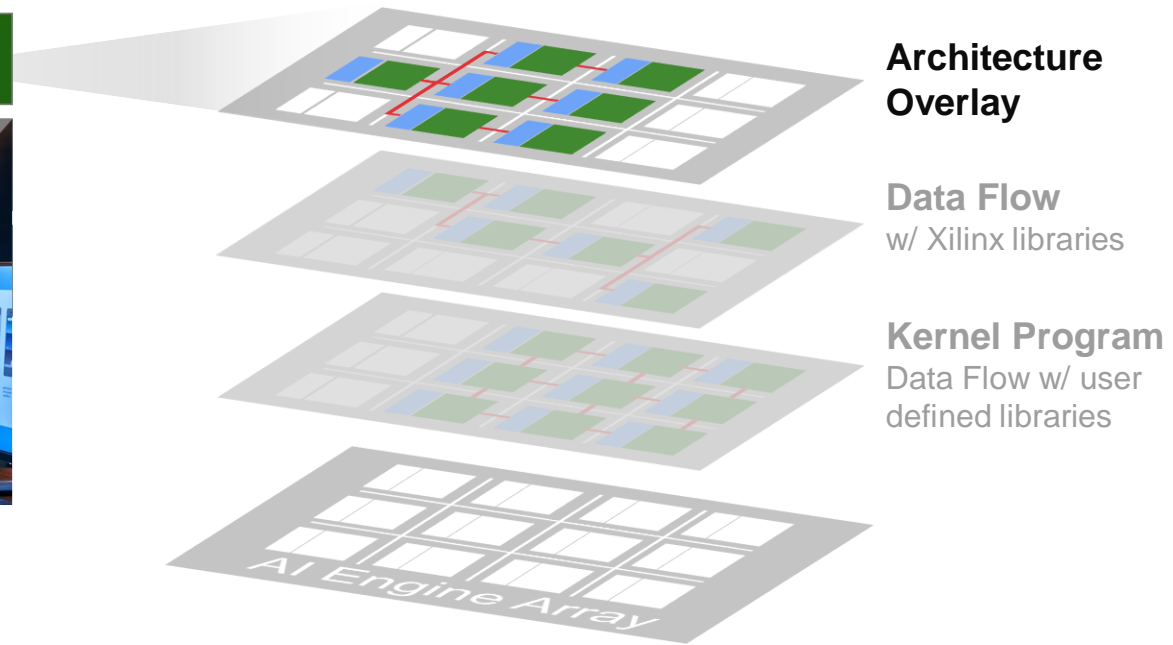

- > Custom memory hierarchy
 - > Buffer on-chip vs off-chip; Reduce latency and power
- > Stream Multi-cast on AI interconnect
 - > Weights and Activations
 - > Read once: reduce memory bandwidth
- > AI-optimized vector instructions (128 INT8 mults/cycle)

Frameworks for Any Developer

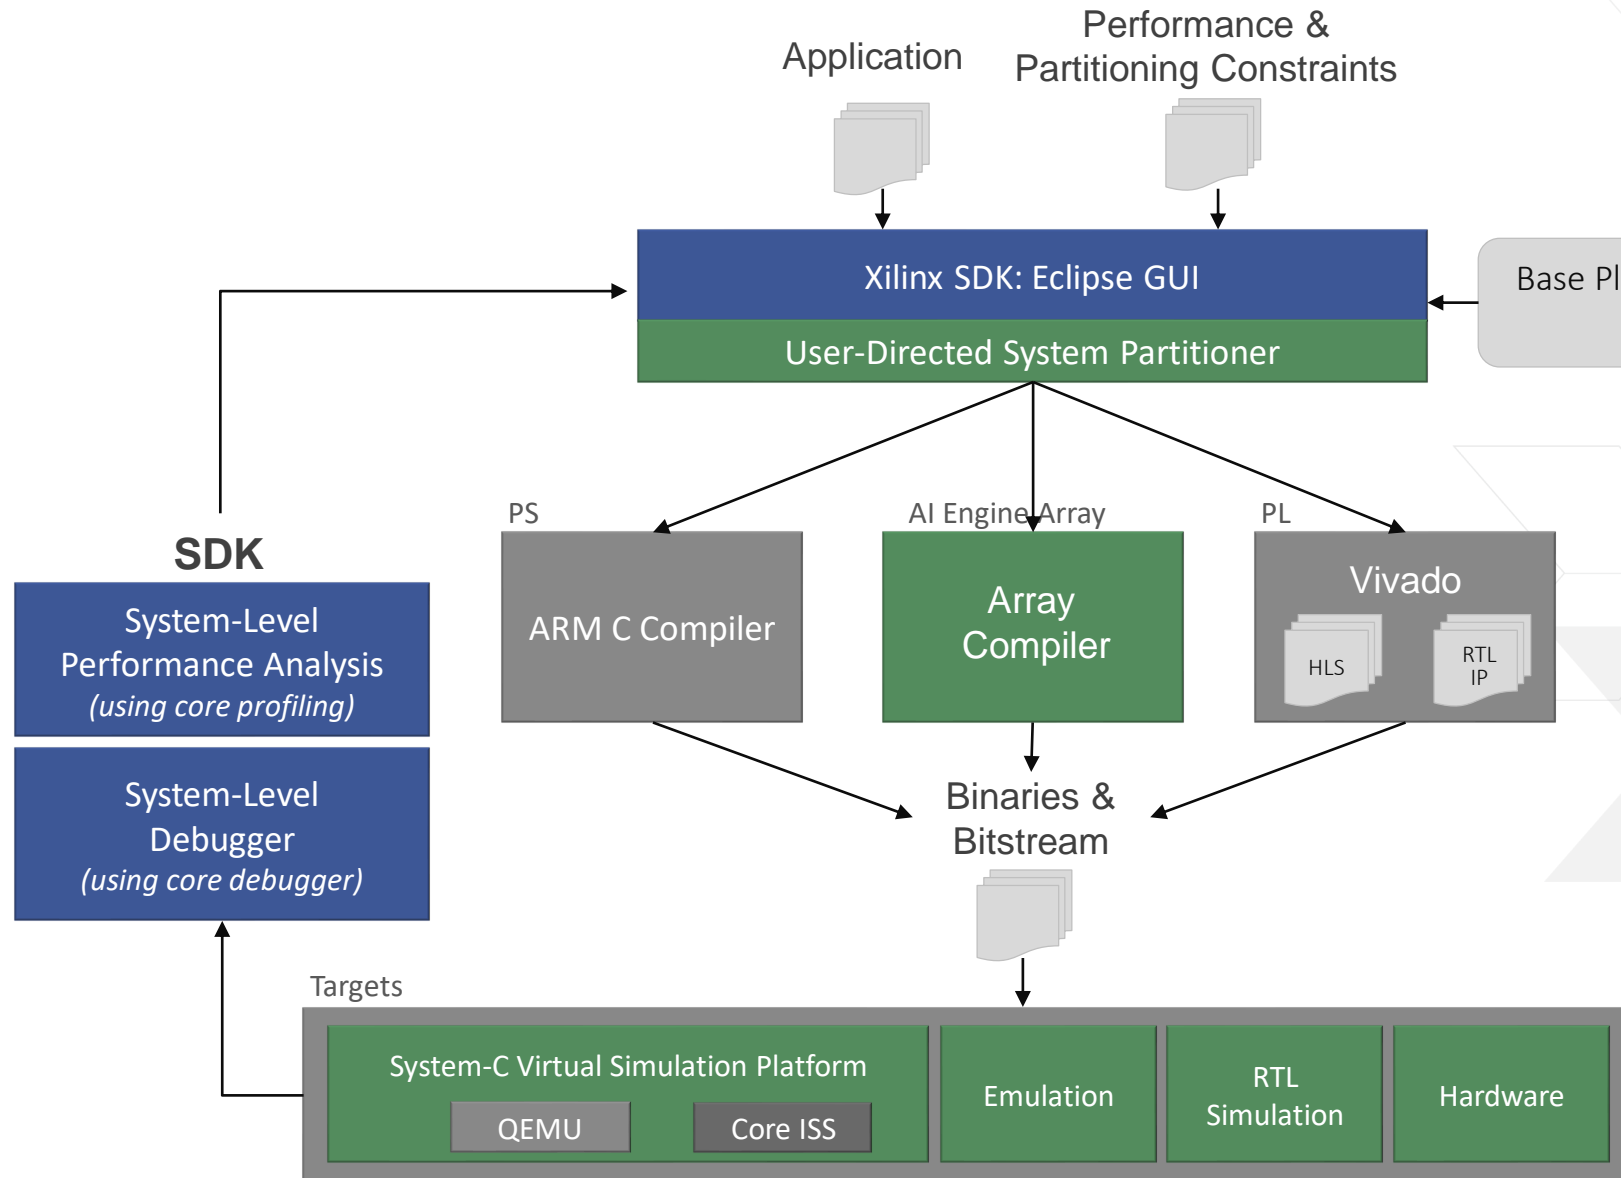

Domain Specific Architecture (e.g. AI Inference)

Target Domain Specific Architectures – No HW Design Experience Required

Unified Tool Chain for Device Programming
