IP Facts

Introduction

The Xilinx LogiCORE[™] IP AXI Root Port/ Endpoint (RP/EP) Bridge for PCI Express® core is an interface between the AXI4 and PCI Express. Definitions and references are provided in this document for all of the functional modules, registers, and interfaces that are implemented in the AXI Bridge for PCI Express core. Definitions are also provided for the hardware implementation and software interfaces to the AXI Bridge for PCI Express core in supported FPGA devices.

Features

- Zynq®-7000, Kintex®-7, Virtex®-7, and Artix®-7 FPGA Integrated Blocks for PCI Express
- Maximum Payload Size (MPS) up to 256 bytes
- Multiple Vector Messaged Signaled Interrupts (MSIs)
- Legacy interrupt support
- Memory-mapped AXI4 access to PCIe® space
- PCIe access to memory-mapped AXI4 space
- Tracks and manages Transaction Layer Packets (TLPs) completion processing
- Detects and indicates error conditions with interrupts
- Optimal AXI4 pipeline support for enhanced performance
- Compliant with Advanced RISC Machine (ARM®) Advanced Microcontroller Bus Architecture 4 (AMBA®) AXI4 specification
- Supports up to three PCIe 32-bit or 64-bit PCIe Base Address Registers (BARs) as Endpoint
- Supports a single PCIe 32-bit or 64-bit BAR as Root Port

Support				
Provided by Xilinx @ www.xilinx.com/support				

Notes:

- 1. For a complete list of supported devices, see the Vivado IP catalog. See also Table 2-1, page 11.
- Standalone driver details can be found in the SDK directory (*<install_directory>*/doc/usenglish/xilinx_drivers.htm). Linux OS and driver support information is available from wiki.xilinx.com.
- 3. For the supported versions of the tools, see the Xilinx Design Tools: Release Notes Guide.
- 4. Except for XC7VX485T, Virtex 7 devices are not supported.

Chapter 1

Overview

The AXI Bridge for PCI Express® core is designed for the Vivado® IP integrator in the Vivado Design Suite. The AXI Bridge for PCI Express core provides an interface between an AXI4 customer user interface and PCI Express using the Xilinx Integrated Block for PCI Express. The AXI Bridge for PCI Express core provides the translation level between the AXI4 embedded system to the PCI Express system. The AXI Bridge for PCI Express core translates the AXI4 memory read or writes to PCIe Transaction Layer Packets (TLP) packets and translates PCIe memory read and write request TLP packets to AXI4 interface commands.

The architecture of the AXI Bridge for PCI Express is shown in Figure 1-1.

Figure 1-1: High-Level AXI Bridge for PCI Express Architecture

Feature Summary

The AXI Bridge for PCI Express core is an interface between the AXI4 and PCI Express. It contains the memory mapped AXI4 to AXI4-Stream Bridge and the AXI4-Stream Enhanced Interface Block for PCIe. The memory-mapped AXI4 to AXI4-Stream Bridge contains a register block and two functional half bridges, referred to as the Slave Bridge and Master Bridge. The Slave Bridge connects to the AXI4 Interconnect as a slave device to handle any issued AXI4 master read or write requests. The Master Bridge connects to the AXI4 Interconnects to the AXI4 Interconnect as a slave device to handle any issued AXI4 master read or write requests. The Master Bridge connects to the AXI4 Interconnect as a slave device to the AXI4 Interconnect as a master to process the PCIe generated read or write TLPs. The core uses a set of interrupts to detect and flag error conditions.

The AXI Bridge for PCI Express core supports both Root Port and Endpoint configurations.

- When configured as an Endpoint, the AXI Bridge for PCI Express core supports up to three 32-bit or 64-bit PCIe Base Address Registers (BARs).
- When configured as a Root Port, the core supports a single 32-bit or 64-bit PCIe BAR.

The AXI Bridge for PCI Express core is compliant with the *PCI Express Base Specification v2.0* [Ref 5] and with the AMBA® AXI4 specification [Ref 4].

Unsupported Features

The following features are not supported in the AXI Bridge for PCI Express core.

- Tandem PROM and Tandem PCIe
- Advanced Error Reporting (AER)

Limitations

Reference Clock for PCIe Frequency Value

The REFCLK input used by the serial transceiver for PCIe must be 100 MHz or 250 MHz for 7 series and Zynq®-7000 device configurations. The C_REF_CLK_FREQ parameter is used to set this value, as defined in Table 2-4, page 16.

Licensing and Ordering Information

This Xilinx LogiCORE[™] IP module is provided at no additional cost with the Xilinx Vivado Design Suite under the terms of the Xilinx End User License.

Information about this and other Xilinx LogiCORE IP modules is available at the <u>Xilinx</u> <u>Intellectual Property</u> page. For information on pricing and availability of other Xilinx LogiCORE IP modules and tools, contact your <u>local Xilinx sales representative</u>.

For more information, visit the AXI Bridge for PCI Express product page.

Chapter 2

Product Specification

Figure 2-1 shows the architecture of the AXI Bridge for PCI Express® core.

AXI PCIe Bridge

Figure 2-1: AXI Bridge for PCI Express Architecture

The Register block contains registers used in the AXI Bridge for PCI Express core for dynamically mapping the AXI4 memory mapped (MM) address range provided using the AXIBAR parameters to an address for PCIe range.

The Slave Bridge provides termination of memory-mapped AXI4 transactions from an AXI master device (such as a processor). The Slave Bridge provides a way to translate addresses that are mapped within the AXI memory mapped address domain to the domain addresses for PCIe. When a remote AXI master initiates a write transaction to the Slave Bridge, the write address and qualifiers are captured and write data is queued in a first in first out (FIFO). These are then converted into one or more MemWr TLPs, depending on the

configured Max Payload Size setting, which are passed to the Integrated Block for PCI Express.

A second remote AXI master initiated write request write address and qualifiers can then be captured and the associated write data queued, pending the completion of the previous write TLP transfer to the core. The resulting AXI Slave Bridge write pipeline is two-deep.

When a remote AXI master initiates a read transaction to the Slave Bridge, the read address and qualifiers are captured and a MemRd request TLP is passed to the core and a completion timeout timer is started. Completions received through the core are correlated with pending read requests and read data is returned to the AXI master. The Slave bridge is capable of handling up to eight memory mapped AXI4 read requests with pending completions.

The Master Bridge processes both PCIe MemWr and MemRd request TLPs received from the integrated block for PCI Express and provides a means to translate addresses that are mapped within the address for PCIe domain to the memory mapped AXI4 address domain. Each PCIe MemWr request TLP header is used to create an address and qualifiers for the memory mapped AXI4 bus and the associated write data is passed to the addressed memory mapped AXI4 Slave. The Master Bridge can support up to four active PCIe MemWr request TLPs.

Each PCIe MemRd request TLP header is used to create an address and qualifiers for the memory-mapped AXI4 bus. Read data is collected from the addressed memory mapped AXI4 Slave and used to generate completion TLPs which are then passed to the integrated block for PCI Express. The Master bridge can handle up to four read requests with pending completions for improved AXI4 pipelining performance.

The instantiated AXI4-Stream Enhanced PCIe block contains submodules including the Requester/Completer interfaces to the AXI bridge and the Register block. The Register block contains the status, control, interrupt registers, and the AXI4-Lite interface.

Standards

The AXI Bridge for PCIe core is compliant with the ARM® AMBA® AXI4 Protocol Specification [Ref 4] and the PCI Express Base Specification v2.0 [Ref 5].

Performance

Figure 2-2 shows a configuration diagram for a target FPGA.

Figure 2-2: FPGA System Configuration Diagram

The target FPGA is filled with logic to drive the lookup table (LUT) and block RAM utilization to approximately 70% and the I/O utilization to approximately 80%.

Maximum Frequencies

The maximum frequency for the AXI clock is 125 MHz for 7 series FPGAs.

Line Rate Support for PCIe Gen1/Gen2

The link speed, number of lanes supported, and support of line rate for PCIe are defined in Table 2-1. Achieving line rate for PCIe is dependent on the device family, the AXI clock

frequency, the AXI data width, the number of lanes, and Gen1 (2.5 GT/s) or Gen2 (5.0 GT/s) link speed.

C_FAMILY	AXI_ACLK Frequency	C_X_AXI_DATA_WIDTH	C_NO_OF_LANES	Gen1 (2.5 GT/s)	Gen2 (5.0 GT/s)	
	7 series, Zvng®-7000 125 MHz			x1	Yes	Yes
		64	x2	Yes	Yes	
7 series, Zynq®-7000			x4	Yes	No	
	100	x4	Yes	Yes		
		128	x8	Yes ⁽¹⁾	No	

Notes:

1. Artix-7 does not support x8 Gen1.

Resource Utilization

Table 2-2 illustrates a subset of IP core configurations and the device utilization estimates. Variation in tools and optimization settings can result in variance of these reported numbers.

Table 2-2 shows the resource utilization for the AXI Bridge for PCIe core for different configurations on a Virtex-7 device. These numbers were generated in the Vivado Design Suite. Resource Utilization numbers for other devices can be generated by implementing the provided example design and checking for the resources used by only the core in the resource utilization report.

Configuration	Slice Registers	Slice LUTs
Endpoint x1 Gen1	8678	13054
Endpoint x2 Gen1	8963	13300
Endpoint x4 Gen1	9558	13666
Endpoint x8 Gen1	11912	17355
Endpoint x1 Gen2	8620	14041
Endpoint x2 Gen2	8897	14362
Endpoint x4 Gen2	10629	16477
Root Port x1 Gen1	10703	15909
Root Port x2 Gen1	10836	15537
Root Port x4 Gen1	11431	15924
Root Port x8 Gen1	13805	20128
Root Port x1 Gen2	10674	16734
Root Port x2 Gen2	11062	17137
Root Port x4 Gen2	12563	19325

pci_exp_txn[c_no_of_lanes-1:0]	0	PCIe TX serial interface

Table 2-3: Top-Level Interface Signals (Cont'd)

Bridge Parameters

Because many features in the AXI Bridge for PCI Express core design can be parameterized, you are able to uniquely tailor the implementation of the core using only the resources required for the desired functionality. This approach also achieves the best possible performance with the lowest resource usage.

The parameters defined for the AXI Bridge for PCI Express are shown in Table 2-4.

Table 2-4: Top-Level Parameters

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
		Bridge P	arameters		
	C_PCIE_BLK_LOCN	PCIe hard block location within FPGA	0: X0Y0 1: X0Y1 2: X0Y2 3: X1Y0 4: X1Y1	0	String
	C_XLNX_REF_BOARD	Target FPGA Board	NONE KC705_REVA KC705_REVB KC705_REVC VC707	NONE	String
G1	C_FAMILY	Target FPGA Family	kintex7, virtex7, artix7, zynq		String
G2	C_INCLUDE_RC	Configures the AXI bridge for PCIe to be a Root Port or an Endpoint	0: Endpoint 1: Root Port (applies only for 7 series, and Zynq-7000 devices)	0	Integer
G3	C_COMP_TIMEOUT	Selects the Slave Bridge completion timeout counter value	0: 50 µs 1: 50 ms	0	Integer
G4	C_INCLUDE_ BAROFFSET_REG	Include the registers for high-order bits to be substituted in translation in Slave Bridge	0: Exclude 1: Include	0	Integer
G5	C_SUPPORTS_ NARROW_BURST	Instantiates internal logic to support narrow burst transfers. Only enable when AXI master bridge generates narrow burst traffic.	0: Not supported 1: Supported	0	Integer
G6	C_AXIBAR_NUM	Number of AXI address apertures that can be accessed	1-6; 1: BAR_0 enabled 2: BAR_0, BAR_1 enabled 3: BAR_0, BAR_1, BAR_2 enabled 4: BAR_0 through BAR_3 enabled 5: BAR_0 through BAR_4 enabled 6: BAR_0 through BAR_5 enabled	6	Integer

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
G7	C_AXIBAR_0	AXI BAR_0 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFFF	std_logic_ vector
G8	C_AXIBAR_ HIGHADDR_0	AXI BAR_0 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G9	C_AXIBAR_AS_0	AXI BAR_0 address size	0: 32 bit 1: 64 bit	0	Integer
G10	C_AXIBAR2PCIEBAR_0	PCIe BAR to which AXI BAR_0 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFFF	std_logic_ vector
G11	C_AXIBAR_1	AXI BAR_1 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFFF	std_logic_ vector
G12	C_AXIBAR_ HIGHADDR_1	AXI BAR_1 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G13	C_AXIBAR_AS_1	AXI BAR_1 address size	0: 32 bit 1: 64 bit	0	Integer
G14	C_AXIBAR2PCIEBAR_1	PCIe BAR to which AXI BAR_1 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFF	std_logic_ vector
G15	C_AXIBAR_2	AXI BAR_2 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFFF	std_logic_ vector
G16	C_AXIBAR_ HIGHADDR_2	AXI BAR_2 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G17	C_AXIBAR_AS_2	AXI BAR_2 address size	0: 32 bit 1: 64 bit	0	Integer
G18	C_AXIBAR2PCIEBAR_2	PCIe BAR to which AXI BAR_2 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFFF	std_logic_ vector
G19	C_AXIBAR_3	AXI BAR_3 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFFF	std_logic_ vector
G20	C_AXIBAR_ HIGHADDR_3	AXI BAR_3 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G21	C_AXIBAR_AS_3	AXI BAR_3 address size	0: 32 bit 1: 64 bit	0	Integer
G22	C_AXIBAR2PCIEBAR_3	PCIe BAR to which AXI BAR_3 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFF	std_logic_ vector
G23	C_AXIBAR_4	AXI BAR_4 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFFF	std_logic_ vector
G24	C_AXIBAR_ HIGHADDR_4	AXI BAR_4 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G25	C_AXIBAR_AS_4	AXI BAR_4 address size	0: 32 bit 1: 64 bit	0	Integer

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
G26	C_AXIBAR2PCIEBAR_4	PCIe BAR to which AXI BAR_4 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFF	std_logic_ vector
G27	C_AXIBAR_5	AXI BAR_5 aperture low address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0xFFFF_FFF	std_logic_ vector
G28	C_AXIBAR_ HIGHADDR_5	AXI BAR_5 aperture high address	Valid AXI address ⁽¹⁾⁽³⁾⁽⁴⁾	0x0000_0000	std_logic_ vector
G29	C_AXIBAR_AS_5	AXI BAR_5 address size	0: 32 bit 1: 64 bit	0	Integer
G30	C_AXIBAR2PCIEBAR_5	PCIe BAR to which AXI BAR_5 is mapped	Valid address for PCIe ⁽²⁾	0xFFFF_FFFF	std_logic_ vector
G31	C_PCIEBAR_NUM	Number of address for PCIe apertures that can be accessed	1-3; 1: BAR_0 enabled 2: BAR_0, BAR_1 enabled 3: BAR_0, BAR_1, BAR_2 enabled	3	Integer
G32	C_PCIEBAR_AS	Configures PCIEBAR aperture width to be 32 bits wide or 64 bits wide	0: Generates three 32-bit PCIEBAR address apertures. 32-bit BAR example: PCIEBAR_0 is 32 bits PCIEBAR_1 is 32 bits PCIEBAR_2 is 32 bits 1: Generates three 64 bit PCIEBAR address apertures. 64-bit BAR example: PCIEBAR_0 and PCIEBAR_1 concatenate to comprise 64-bit PCIEBAR_0. PCIEBAR_2 and PCIEBAR_3 concatenate to comprise 64-bit PCIEBAR_1. PCIEBAR_4 and PCIEBAR_5 concatenate to comprise 64-bit PCIEBAR_2	1	Integer
G33	C_PCIEBAR_LEN_0	Power of 2 in the size of bytes of PCIE BAR_0 space	13-31	16	Integer
G34	C_PCIEBAR2AXIBAR_0	AXIBAR to which PCIE BAR_0 is mapped	Valid AXI address	0x0000_0000	std_logic_ vector

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
	C_PCIEBAR2AXIBAR_0 _SEC	Defines the AXIBAR memory space (PCIe BAR_0) (accessible from PCIe) to be either secure or non-secure memory mapped.	0: Denotes a non-secure memory space 1: Marks the AXI memory space as secure	0	Integer
G35	C_PCIEBAR_LEN_1	Power of 2 in the size of bytes of PCIE BAR_1 space	13-31	16	Integer
G36	C_PCIEBAR2AXIBAR_1	AXIBAR to which PCIE BAR_1 is mapped	Valid AXI address	0x0000_0000	std_logic_ vector
	C_PCIEBAR2AXIBAR_1 _SEC	Defines the AXIBAR memory space (PCIe BAR_1) (accessible from PCIe) to be either secure or non-secure memory mapped.	0: Denotes a non-secure memory space 1: Marks the AXI memory space as secure	0	Integer
G37	C_PCIEBAR_LEN_2	Power of 2 in the size of bytes of PCIE BAR_2 space	13-31	16	Integer
G38	C_PCIEBAR2AXIBAR_2	AXIBAR to which PCIE BAR_2 is mapped	Valid AXI address	0x0000_0000	std_logic_ vector
	C_PCIEBAR2AXIBAR_2 _SEC	Defines the AXIBAR memory space (PCIe BAR_2) (accessible from PCIe) to be either secure or non-secure memory mapped.	0: Denotes a non-secure memory space 1: Marks the AXI memory space as secure	0	Integer
	-	AXI4-Lite	Parameters		
G39	C_BASEADDR	Device base address Note: When configured as an RP, the minimum alignment granularity must be 256 MB. Bit [27:0] are used for Bus Number, Device Number, Function number.	Valid AXI address	0xFFFF_FFFF	std_logic_ vector
G40	C_HIGHADDR	Device high address	Valid AXI address	0x0000_0000	std_logic_ vector

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
	C_S_AXI_CTL_ PROTOCOL	AXI4-Lite port connection definition to AXI Interconnect in the Vivado IP integrator system	AXI4LITE	AXI4LITE	string
	-	Core for PCIe Confi	guration Parameters	•	•
G41	C_NO_OF_LANES	Number of PCIe Lanes	1, 2, 4, 8: 7 series FPGAs	1	integer
G42	C_DEVICE_ID	Device ID	16-bit vector	0x0000	std_logic_ vector
G43	C_VENDOR_ID	Vendor ID	16-bit vector	0x0000	std_logic_ vector
G44	C_CLASS_CODE	Class Code	24-bit vector	0x00_0000	std_logic_ vector
G45	C_REV_ID	Rev ID	8-bit vector	0x00	std_logic_ vector
G46	C_SUBSYSTEM_ID	Subsystem ID	16-bit vector	0x0000	std_logic_ vector
G47	C_SUBSYSTEM_ VENDOR_ID	Subsystem Vendor ID	16-bit vector	0x0000	std_logic_ vector
	C_PCIE_USE_MODE	Specifies PCIe use mode for underlying serial transceiver wrapper usage/ configuration (specific only to 7 series). This parameter ignored for Zynq-7000 devices (set to "3.0").	See Table 2-6. 1.0: For Kintex-7 325T IES (initial ES) silicon 1.1: For Virtex-7 485T IES (initial ES) silicon 3.0: For GES (general ES) silicon	1.0	string
G48	C_PCIE_CAP_SLOT_ IMPLEMENTED	PCIE Capabilities Register Slot Implemented	0: Not add-in card slot 1: Downstream port is connected to add-in card slot (valid only for Root Complex)	0	integer
G49	C_REF_CLK_FREQ	REFCLK input Frequency	0: 100 MHz 2: 250 MHz - 7 series FPGAs only	0	integer

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type	
	C_NUM_MSI_REQ	Specifies the size of the MSI request vector for selecting the number of requested message values.	0-5	0	integer	
Memory Mapped AXI4 Parameters						
G50	C_M_AXI_DATA_ WIDTH	AXI Master Bus Data width	64: 7 series FPGAs only 128: 7 series FPGAs only	64	integer	
G51	C_M_AXI_ADDR_ WIDTH	AXI Master Bus Address width	32	32	integer	
G52	C_S_AXI_ID_WIDTH	AXI Slave Bus ID width	4	4	integer	
G53	C_S_AXI_DATA_ WIDTH	AXI Slave Bus Data width	64: 7 series FPGAs only 128: 7 series FPGAs only	64	integer	
G54	C_S_AXI_ADDR_ WIDTH	AXI Slave Bus Address width	32	32	integer	
	C_M_AXI_PROTOCOL	Protocol definition for M_AXI (Master Bridge) port on AXI Interconnect in the Vivado IP integrator system	AXI4	AXI4	string	
	C_S_AXI_PROTOCOL	Protocol definition for S_AXI (Slave Bridge) port on AXI Interconnect in the Vivado IP integrator system	AXI4	AXI4	string	
G55	C_MAX_LINK_ SPEED	Maximum PCIe link speed supported	0: 2.5 GT/s - 7 series 1: 5.0 GT/s - 7 series	0	integer	
G56	C_INTERRUPT_PIN	Legacy INTX pin support/select	0: No INTX support (setting for Root Port) 1: INTA selected (only allowable when core in Endpoint configuration)	0	integer	
		AXI4 Intercon	nect Parameters			
G57	NUM_WRITE_ OUTSTANDING	AXI Interconnect Slave Port Write Pipeline Depth	1: Only one active AXI AWADDR can be accepted in the AXI slave bridge for PCIe 2: Maximum of two active AXI AWADDR values can be stored in AXI slave bridge for PCIe	2	integer	

Generic	Parameter Name	Description	Allowable Values	Default Value	VHDL Type
G58	NUM_READ_ OUTSTANDING	AXI Interconnect Slave Port Read Pipeline Depth	1: Only one active AXI ARADDR can be accepted in AXI slave bridge PCIe. 2, 4, 8: Size of pipeline for active AXI ARADDR values to be stored in AXI slave bridge PCIe A value of 8 is not allowed for 128-bit core (Gen2 7 series) configurations. The maximum setting of this parameter value is 4.	8	integer
		AXI4 Master Intere	connect Parameters		
G59	NUM_WRITE_ OUTSTANDING	AXI Interconnect Master Bridge write address issue depth	1, 2, 4: Number of actively issued AXI AWADDR values on the AXI Interconnect to the target slave device(s).	4	integer
G60	NUM_READ_ OUTSTANDING	AXI Interconnect Master Bridge read address issue depth	1, 2, 4: Number of actively issued AXI ARADDR values on the AXI Interconnect to the target slave device(s).	4	integer

1. This is a 32-bit address.

2. The width of this should match the address size (C_AXIBAR_AS) for this BAR.

3. The range specified must comprise a complete, contiguous power of two range, such that the range = 2^n and the *n* least significant bits of the Base Address are zero. The address value is a 32-bit AXI address.

- 4. The difference between C_AXIBAR_n and C_AXIBAR_HIGHADDR_n must be less than or equal to 0x7FFF_FFFF and greater than or equal to 0x0000_1FFF.
- 5. It is not recommended to edit these default values on the AXI bridge for PCIe IP unless resource utilization needs to be reduced which impacts the AXI bridge performance.

Parameter Dependencies

Table 2-5 lists the parameter dependencies.

Generic	Parameter	Affects	Depends	Description		
	Bridge Parameters					
G1	C_FAMILY	G2, G41, G49, G55				
G2	C_INCLUDE_RC		G1	Meaningful only if G1 = Kintex-7.		
G3	C_COMP_TIMEOUT					

Table 2-5: Parameter Dependencies (Cont'd)

Generic	Parameter	Affects	Depends	Description
G4	C_INCLUDE_BAROFFSET_REG	G10, G14, G18, G22, G26, G30	G6	If G4 = 0, then G10, G14, G18, G22, G26 and G30 have no meaning. The number of registers included is set by G6.
G5	C_SUPPORTS_NARROW_ BURST			
G6	C_AXIBAR_NUM	G4, G7 - G30		If $G6 = 1$, then $G7 - G10$ are enabled. If $G6 = 2$, then $G7 - G14$ are enabled. If $G6 = 3$, then $G7 - G18$ are enabled. If $G6 = 4$, then $G7 - G22$ are enabled. If $G6 = 5$, then $G7 - G26$ are enabled. If $G6 = 6$, then $G7 - G30$ are enabled.
G7	C_AXIBAR_0	G8	G6, G8	G7 and G8 define the range in AXI memory space that is responded to by this device (AXIBAR)
G8	C_AXIBAR_HIGHADDR_0	G7	G6, G7	G7 and G8 define the range in AXI memory space that is responded to by this device (AXIBAR)
G9	C_AXIBAR_AS_0		G6	
G10	C_AXIBAR2PCIEBAR_0		G4, G6	Meaningful when G4 = 1.
G11	C_AXIBAR_1	G12	G12	G11 and G12 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G12	C_AXIBAR_HIGHADDR_1	G11	G6, G11	G11 and G12 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G13	C_AXIBAR_AS_1		G6	
G14	C_AXIBAR2PCIEBAR_1		G4, G6	Meaningful when G4 = 1.
G15	C_AXIBAR_2	G16	G16	G15 and G16 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G16	C_AXIBAR_HIGHADDR_2	G15	G6, G15	G15 and G16 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G17	C_AXIBAR_AS_2		G 6	
G18	C_AXIBAR2PCIEBAR_2		G4, G6	Meaningful when G4 = 1.
G19	C_AXIBAR_3	G20	G20	G19 and G20 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G20	C_AXIBAR_HIGHADDR_3	G19	G6, G19	G19 and G20 define the range in AXI-memory space that is responded to by this device (AXIBAR)

Table 2-5: Parameter Dependencies (Cont'd)

Generic	Parameter	Affects	Depends	Description
G21	C_AXIBAR_AS_3		G6	
G22	C_AXIBAR2PCIEBAR_3		G4, G6	Meaningful when G4 = 1.
G23	C_AXIBAR_4	G24	G24	G23 and G24 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G24	C_AXIBAR_HIGHADDR_4	G23	G6, G23	G23 and G24 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G25	C_AXIBAR_AS_4		G6	
G26	C_AXIBAR2PCIEBAR_4		G4, G6	Meaningful if G4 = 1.
G27	C_AXIBAR_5	G28	G28	G27 and G28 define the range in AXI-memory space that is responded to by this device (AXIBAR)
G28	C_AXIBAR_HIGHADDR_5 G27 G6, G27 AXI-memory space		G27 and G28 define the range in AXI-memory space that is responded to by this device (AXIBAR)	
G29	C_AXIBAR_AS_5		G6	
G30	C_AXIBAR2PCIEBAR_5		G4, G6	Meaningful if G4 = 1.
G31	C_PCIEBAR_NUM	G33-G38		If G31 = 1, then G32, G33 are enabled. If G31 = 2, then G32 - G36 are enabled. If G31 = 3, then G32 - G38 are enabled
G32	C_PCIEBAR_AS			
G33	C_PCIEBAR_LEN_0	G34	G31	
G34	C_PCIEBAR2AXIBAR_0		G31, G33	Only the high-order bits above the length defined by G33 are meaningful.
G35	C_PCIEBAR_LEN_1	G36	G31	
G36	C_PCIEBAR2AXIBAR_1		G31, G35	Only the high-order bits above the length defined by G35 are meaningful.
G37	C_PCIEBAR_LEN_2	G38	G31	
G38	C_PCIEBAR2AXIBAR_2		G31, G37	Only the high-order bits above the length defined by G37 are meaningful.

Table 2-6 summarizes the relationship between the IP design parameters, C_FAMILY and C_PCIE_USE_MODE. The C_PCIE_USE_MODE is used to specify the 7 series (and derivative FPGA technology) serial transceiver wrappers to use based on the silicon version. Initial Engineering Silicon (IES) as well as General Engineering Silicon (GES) must be specified.

Table 2-6: Silicon Version Specification

C_FAMILY	C_PCIE_USE_MODE
Kintex-7	"1.1" = for Kintex-7 325T IES (initial silicon) "3.0" = for GES (general silicon)
Virtex-7	"1.1" = for Virtex-7 485T IES (initial silicon) "3.0" = for GES and Production (general silicon and Production silicon)
Artix-7	"1.0" = for IES (initial silicon) as well as GES and Production (General silicon and Production silicon) to use latest serial transceiver wrappers (only allowable value)
Zynq	Not applicable. (set internally = "3.0")

Memory Map

The memory map shown in Table 2-7 shows the address mapping for the AXI Bridge for PCI Express core. These registers are described in more detail in the following section. All registers are accessed through the AXI4-Lite Control Interface and are offset from C_BASEADDR. During a reset, all registers return to default values.

Accessibility	Offset	Contents	Location
RO - EP, R/W - RC	0x000 - 0x124	PCIe Configuration Space Header	Part of integrated PCIe configuration space.
RO	0x128	Vendor-Specific Enhanced Capability (VSEC) Capability	VSEC of integrated PCIe
RO	0x12C	VSEC Header	- configuration space.
RO	0x130	Bridge Info	
RO - EP, R/W - RC	0x134	Bridge Status and Control	-
R/W	0x138	Interrupt Decode	-
R/W	0x13C	Interrupt Mask	
RO - EP, R/W - RC	0x140	Bus Location	-
RO	0x144	Physical-Side Interface (PHY) Status/Control	AXI bridge defined memory-mapped register space.
RO - EP, R/W - RC	0x148	Root Port Status/Control	
RO - EP, R/W - RC	0x14C	Root Port MSI Base 1	
RO - EP, R/W - RC	0x150	Root Port MSI Base 2	-
RO - EP, R/W - RC	0x154	Root Port Error FIFO Read	
RO - EP, R/W - RC	0x158	Root Port Interrupt FIFO Read 1	-
RO - EP, R/W - RC	0x15C	Root Port Interrupt FIFO Read 2	
RO	0x160 - 0x1FF	Reserved (zeros returned on read)	
RO	0x200	VSEC Capability 2	

Table 2-7: Register Memory Map

Accessibility	Offset	Contents	Location
RO	0x204	VSEC Header 2	
R/W	0x208 - 0x234	AXI Base Address Translation Configuration Registers	AXI bridge defined memory-mapped space.
RO	0x238 - 0xFFF	Reserved (zeros returned on read)	

Table 2-7: Register Memory Map (Cont'd)

PCIe Configuration Space Header

The PCIe Configuration Space Header is a memory aperture for accessing the core for PCIe configuration space. For 7 series devices, this area is read-only when configured as an Endpoint. Writes are permitted for some registers when a 7 series device is configured as a Root Port. Special access modes can be enabled using the PHY Status/Control register. All reserved or undefined memory-mapped addresses must return zero and writes have no effect.

VSEC Capability Register (Offset 0x128)

The VSEC Capability register (described in Table 2-8) allows the memory space of the core to appear as though it is a part of the underlying core configuration space. The VSEC is inserted immediately following the last enhanced capability structure in the underlying block. VSEC is defined in §7.18 of the *PCI Express Base Specification*, v1.1 (§7.19 of v2.0) [Ref 5].

Bits	Name	Core Access	Reset Value	Description
15:0	VSEC Capability ID	RO	0x000B	PCI-SIG [®] defined ID identifying this Enhanced Capability as a Vendor-Specific capability. Hardcoded to 0x000B.
19:16	Capability Version	RO	0x1	Version of this capability structure. Hardcoded to 0x1.
31:20	Next Capability Offset	RO	0x200	Offset to next capability. Hardcoded to 0x0200.

VSEC Header Register (Offset 0x12C)

The VSEC Header register (described in Table 2-9) provides a unique (within a given vendor) identifier for the layout and contents of the VSEC structure, as well as its revision and length.

Bits	Name	Core Access	Reset Value	Description
15:0	VSEC ID	RO	0x0001	ID value uniquely identifying the nature and format of this VSEC structure.
19:16	VSEC REV	RO	0	Version of this capability structure. Hardcoded to 0h.
31:20	VSEC Length	RO	0x038	Length of the entire VSEC Capability structure, in bytes, including the VSEC Capability register. Hardcoded to 0x038 (56 decimal).

Bridge Info Register (Offset 0x130)

The Bridge Info register (described in Table 2-10) provides general configuration information about the AXI4-Stream Bridge. Information in this register is static and does not change during operation.

Table 2-10:Bridge Info Register

Bits	Name	Core Access	Reset Value	Description
0	Gen2 Capable	RO	0	If set, indicates the link is Gen2 capable. Underlying Integrated Block and Link partner support PCIe Gen2 speed.
1	Root Port Present	RO	0	Indicates underlying Integrated Block is a Root Port when this bit is set. If set, Root Port registers are present in this interface.
2	Up Config Capable	RO		Indicates underlying Integrated Block is upconfig capable when this bit is set.
15:3	Reserved	RO	0	Reserved
18:16	ECAM Size	RO	0	Size of Enhanced Configuration Access Mechanism (ECAM) Bus Number field, in number of bits. If ECAM window is present, value is between 1 and 8. If not present, value is 0. Total address bits dedicated to ECAM window is 20+(ECAM Size).
				The size of the ECAM is determined by the parameter settings of C_BASEADDR and C_HIGHADDR.
31:19	Reserved	RO	0	Reserved

Bridge Status and Control Register (Offset 0x134)

The Bridge Status and Control register (described in Table 2-11) provides information about the current state of the AXI4-Stream Bridge. It also provides control over how reads and writes to the Core Configuration Access aperture are handled.

Bits	Name	Core Access	Reset Value	Description
0	ECAM Busy	RO	0	Indicates an ECAM access is in progress (waiting for completion).
7:1	Reserved	RO	0	Reserved
8	Global Disable	RW	0	When set, disables interrupt line from being asserted. Does not prevent bits in Interrupt Decode register from being set.
15:9	Reserved	RO	0	Reserved
16	RW1C as RW	RW	0	When set, allows writing to core registers which are normally RW1C.
17	RO as RW	RW	0	When set, allows writing to certain registers which are normally RO. (Only supported for Kintex-7 FPGA cores.)
31:18	Reserved	RO	0	Reserved

Table 2-11: Bridge Status and Control Register

Interrupt Decode Register (Offset 0x138)

The Interrupt Decode register (described in Table 2-12) provides a single location where the host processor interrupt service routine can determine what is causing the interrupt to be asserted and how to clear the interrupt. Writing a 1'b1 to any bit of the Interrupt Decode register clears that bit except for the Correctable, Non-Fatal, and Fatal bits.

Follow this sequence to clear the Correctable, Non-Fatal, and Fatal bits:

- 1. Clear the Root Port Error FIFO (0x154) by performing first a read, followed by write-back of the same register.
- 2. Write to the Interrupt Decode Register (0x138) with '1' to the appropriate error bit to clear it.

IMPORTANT: An asserted bit in the Interrupt Decode register does not cause the interrupt line to assert unless the corresponding bit in the Interrupt Mask register is also set.

Table 2-12:Interrupt Decode Register

Bits	Name	Core Access	Reset Value	Description
0	Link Down	RW1C	0	Indicates that Link-Up on the PCI Express link was lost. Not asserted unless link-up had previously been seen.
1	ECRC Error	RW1C	0	Indicates Received packet failed ECRC check. (Only applicable to Kintex-7 FPGA cores.)
2	Streaming Error	RW1C	0	Indicates a gap was encountered in a streamed packet on the TX interface (RW, RR, or CC).
3	Hot Reset	RW1C	0	Indicates a Hot Reset was detected.
4	Reserved	RO	0	Reserved
7:5	Cfg Completion Status	RW1C	0	Indicates config completion status.
8	Cfg Timeout	RW1C	0	Indicates timeout on an ECAM access. (Only applicable to Root Port cores.)
9	Correctable	RW1C	0	Indicates a correctable error message was received. Requester ID of error message should be read from the Root Port FIFO.
				(Only applicable to Root Port cores.)
10	Non-Fatal	RW1C	0	Indicates a non-fatal error message was received. Requester ID of error message should be read from the Root Port FIFO. (Only applicable to Root Port cores.)
11	Fatal	RW1C	0	Indicates a fatal error message was received. Requester ID of error message should be read from the Root Port FIFO. (Only applicable to Root Port cores.)
15:12	Reserved	RO	0	Reserved
16	INTx Interrupt Received	RW1C	0	Indicates an INTx interrupt was received. Interrupt details should be read from the Root Port FIFO. (Only applicable to Root Port cores.)
17	MSI Interrupt Received	RW1C	0	Indicates an MSI(x) interrupt was received. Interrupt details should be read from the Root Port FIFO. (Only applicable to Root Port cores.)
19:18	Reserved	RO	0	Reserved
20	Slave Unsupported Request	RW1C	0	Indicates that a completion TLP was received with a status of 0b001 - Unsupported Request.
21	Slave Unexpected Completion	RW1C	0	Indicates that a completion TLP was received that was unexpected.
22	Slave Completion Timeout	RW1C	0	Indicates that the expected completion TLP(s) for a read request for PCIe was not returned within the time period selected by the C_COMP_TIMEOUT parameter.
23	Slave Error Poison	RW1C	0	Indicates the EP bit was set in a completion TLP.

www.xilinx.com

Bits	Name	Core Access	Reset Value	Description
24	Slave Completer Abort	RW1C	0	Indicates that a completion TLP was received with a status of 0b100 - Completer Abort.
25	Slave Illegal Burst	RW1C	0	Indicates that a burst type other than INCR was requested by the AXI master.
26	Master DECERR	RW1C	0	Indicates a Decoder Error (DECERR) response was received.
27	Master SLVERR	RW1C	0	Indicates a Slave Error (SLVERR) response was received.
28	Master Error Poison	RW1C	0	Indicates an EP bit was set in a MemWR TLP for PCIe.
31:29	Reserved	RO	0	Reserved

Table 2-12: Interrupt Decode Register (Cont'd)

Interrupt Mask Register (Offset 0x13C)

The Interrupt Mask register controls whether each individual interrupt source can cause the interrupt line to be asserted. A one in any location allows the interrupt source to assert the interrupt line. The Interrupt Mask register initializes to all zeros. Therefore, by default no interrupt is generated for any event. Table 2-13 describes the Interrupt Mask register bits and values.

Bits	Name	Core Access	Reset Value	Description
0	Link Down	RW	0	Enables interrupts for Link Down events when bit is set.
1	ECRC Error	RW	0	Enables interrupts for ECRC Error events when bit is set. (Only writable for EP configurations, otherwise = '0')
2	Streaming Error	RW	0	Enables interrupts for Streaming Error events when bit is set.
3	Hot Reset	RW	0	Enables interrupts for Hot Reset events when bit is set. (Only writable for EP configurations, otherwise = '0')
4	Reserved	RO	0	Reserved
7:5	Cfg Completion Status	RW	0	Enables interrupts for config completion status. (Only writable for Root Port Configurations, otherwise = '0')
8	Cfg Timeout	RO	0	Enables interrupts for Config (Cfg) Timeout events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
9	Correctable	RO	0	Enables interrupts for Correctable Error events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
10	Non-Fatal	RO	0	Enables interrupts for Non-Fatal Error events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
11	Fatal	RO	0	Enables interrupts for Fatal Error events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
15:12	Reserved	RO	0	Reserved

Table 2-13: Interrupt Mask Register

Table 2-13:	Interrupt Mask Register (Cont'd)
-------------	----------------------------------

Bits	Name	Core Access	Reset Value	Description
16	INTx Interrupt Received	RO	0	Enables interrupts for INTx Interrupt events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
17	MSI Interrupt Received	RO	0	Enables interrupts for MSI Interrupt events when bit is set. (Only writable for Root Port Configurations, otherwise = '0')
19:18	Reserved	RO	0	Reserved
20	Slave Unsupported Request	RW	0	Enables the Slave Unsupported Request interrupt when bit is set.
21	Slave Unexpected Completion	RW	0	Enables the Slave Unexpected Completion interrupt when bit is set.
22	Slave Completion Timeout	RW	0	Enables the Slave Completion Timeout interrupt when bit is set.
23	Slave Error Poison	RW	0	Enables the Slave Error Poison interrupt when bit is set.
24	Slave Completer Abort	RW	0	Enables the Slave Completer Abort interrupt when bit is set.
25	Slave Illegal Burst	RW	0	Enables the Slave Illegal Burst interrupt when bit is set.
26	Master DECERR	RW	0	Enables the Master DECERR interrupt when bit is set.
27	Master SLVERR	RW	0	Enables the Master SLVERR interrupt when bit is set.
28	Master Error Poison	RW	0	Enables the Master Error Poison interrupt when bit is set.
31:29	Reserved	RO	0	Reserved

Bus Location Register (Offset 0x140)

The Bus Location register reports the Bus, Device, and Function number, and the Port number for the PCIe port (Table 2-14).

Table 2-14:Bus Location Register

Bits	Name	Core Access	Reset Value	Description
2:0	Function Number	RO	0	Function number of the port for PCIe. Hard-wired to 0.
7:3	Device Number	RO	0	Device number of port for PCIe. For Endpoint, this register is RO and is set by the Root Port.
15:8	Bus Number	RO	0	Bus number of port for PCIe. For Endpoint, this register is RO and is set by the external Root Port.
23:16	Port Number	RW	0	Sets the Port number field of the Link Capabilities register.
31:24	Reserved	RO	0	Reserved

PHY Status/Control Register (Offset 0x144)

The PHY Status/Control register (described in Table 2-15) provides the status of the current PHY state, as well as control of speed and rate switching for Gen2-capable cores.

Bits	Name	Core Access	Reset Value	Description
0	Link Rate	RO	0	Reports the current link rate. 0b = 2.5 GT/s, 1b = 5.0 GT/s.
2:1	Link Width	RO	0	Reports the current link width. $00b = x1$, $01b = x2$, $10b = x4$, $11b = x8$.
8:3	LTSSM State	RO	0	Reports the current Link Training and Status State Machine (LTSSM) state. Encoding is specific to the underlying Integrated Block.
10:9	Lane Reversal	RO	0	Reports the current lane reversal mode. 00b: No reversal 01b: Lanes 1:0 reversed 10b: Lanes 3:0 reversed 11b: Lanes 7:0 reversed
11	Link Up	RO	0	Reports the current PHY Link-up state. 1b: Link up 0b: Link down Link up indicates the core has achieved link up status, meaning the LTSSM is in the L0 state and the core can send/receive data packets.
15:12	Reserved	RO	0	Reserved
17:16	Directed Link Width	RW	0	Specifies completer link width for a directed link change operation. Only acted on when Directed Link Change specifies a width change. 00b: x1 01b: x2 10b: x4 11b: x8
18	Directed Link Speed	RW	0	Specifies completer link speed for a directed link change operation. Only acted on when Directed Link Change specifies a speed change. 0b: 2.5 GT/s 1b: 5.0 GT/s
19	Directed Link Autonomous	RW	0	Specifies link reliability or autonomous for directed link change operation. 0b: Link reliability 1b: Autonomous

Table 2-15: PHY Status/Control Register

Table 2-15: PHY Status/Control Register (Cont'd)

Bits	Name	Core Access	Reset Value	Description
21:20	Directed Link Change	RW	0	Directs LTSSM to initiate a link width and/or speed change. 00b: No change 01b: Force link width 10b: Force link speed 11b: Force link width and speed
31:22	Reserved	RO	0	Reserved

Root Port Status/Control Register (Offset 0x148)

The Root Port Status/Control register provides access to Root Port specific status and control. This register is only implemented for Root Port cores. For non-Root Port cores, reads return 0 and writes are ignored (described in Table 2-16).

Bits	Name	Core Access	Reset Value	Description
0	Bridge Enable	RW	0	When set, allows the reads and writes to the AXIBARs to be presented on the PCIe bus. RP Software needs to write 1 to this bit when enumeration is done. AXI Enhanced PCIe Bridge clears this location when link up to link down transition occurs. Default is set to '0'.
15:1	Reserved	RO	0	Reserved.
16	Error FIFO Not Empty	RO	0	Indicates that the Root Port Error FIFO has data to read.
17	Error FIFO Overflow	RW1C	0	Indicates that the Root Port Error FIFO overflowed and an error message was dropped. Writing a '1' clears the overflow status.
18	Interrupt FIFO Not Empty	RO	0	Indicates that the Root Port Interrupt FIFO has data to read.
19	Interrupt FIFO Overflow	RW1C	0	Indicates that the Root Port Interrupt FIFO overflowed and an interrupt message was dropped. Writing a '1' clears the overflow status
27:20	Completion Timeout	RW	0	Sets the timeout counter size for Completion Timeouts.
31:28	Reserved	RO	0	Reserved.

Table 2-16: Root Port Status/Control Register

Root Port MSI Base Register 1 (Offset 0x14C)

The Root Port MSI Base register contains the upper 32-bits of the 64-bit MSI address (described in Table 2-17).

For EP configurations, read returns zero.

Table 2-17: Root Port MSI Base Register 1

Bits	Name	Core Access	Reset Value	Description
31:0	MSI Base	RW	0	4Kb-aligned address for MSI interrupts. In case of 32-bit MSI, it returns 0 but captures the upper 32-bits of the MSI address in case of 64-bit MSI.

Root Port MSI Base Register 2 (Offset 0x150)

The Root Port MSI Base register 2 (described in Table 2-18) sets the address window in Root Port cores used for MSI interrupts. MemWr TLPs to addresses in this range are interpreted as MSI interrupts. MSI TLPS are interpreted based on the address programmed in this register. The window is always 4 Kb, beginning at the address indicated in this register. For EP configurations, a read returns zero. However, the AXI Bridge for PCI Express core does not support MSI-X and multiple vector address, only single MSI is supported.

Table 2-18: Root Port MSI Base Register 2

Bits	Name	Core Access	Reset Value	Description
11:0	Reserved	RO	0	Reserved
31:12	MSI Base	RW	0	4 Kb-aligned address for MSI interrupts.

Root Port Error FIFO Read Register (Offset 0x154)

Reads from this location return queued error (Correctable/Non-fatal/Fatal) messages. Data from each read follows the format shown in Table 2-19. For EP configurations, read returns zero.

Reads are non-destructive. Removing the message from the FIFO requires a write. The write value is ignored.

Bits	Name	Core Access	Reset Value	Description
15:0	Requester ID	RWC	0	Requester ID belonging to the requester of the error message.
17:16	Error Type	RWC	0	Indicates the type of the error. 00b: Correctable 01b: Non-Fatal 10b: Fatal 11b: Reserved
18	Error Valid	RWC	0	Indicates whether read succeeded. 1b: Success 0b: No message to read
31:19	Reserved	RO	0	Reserved

Table 2-19:Root Port Error FIFO Read Register

Root Port Interrupt FIFO Read Register 1 (Offset 0x158)

Reads from this location return queued interrupt messages. Data from each read follows the format shown in Table 2-20. For MSI interrupts, the message payload is presented in the Root Port Interrupt FIFO Read 2 register. The interrupt-handling flow should be to read this register first, immediately followed by the Root Port Interrupt FIFO Read 2 register. For non-Root Port cores, reads return zero.

Note: Reads are non-destructive. Removing the message from the FIFO requires a write to either this register or the Root Port Interrupt FIFO Read 2 register. The write value is ignored.

Bits	Name	Core Access	Reset Value	Description
15:0	Requester ID	RWC	0	Requester ID belonging to the requester of the error message.
26:16	MSI Address	RWC	0	For MSI interrupts, contains address bits 12:2 from the TLP address field.
28:27	Interrupt Line	RWC	0	Indicates interrupt line used. 00b: INTA 01b: INTB 10b: INTC 11b: INTD For MSI, this field is set to 00b and should be ignored.
29	Interrupt Assert	RWC	0	Indicates assert or deassert for INTx. 1b: Assert 0b: Deassert For MSI, this field is set to 0b and should be ignored.
30	MSI Interrupt	RWC	0	Indicates whether interrupt is MSI or INTx. 1b = MSI, 0b = INTx.
31	Interrupt Valid	RWC	0	Indicates whether read succeeded. 1b: Success 0b: No interrupt to read

Table 2-20: Root Port Interrupt FIFO Read Register 1

Root Port Interrupt FIFO Read Register 2 (Offset 0x15C)

Reads from this location return queued interrupt messages. Data from each read follows the format shown in Table 2-21. For MSI interrupts, the message payload is presented in this register, while the header information is presented in the Root Port Interrupt FIFO Read 1 register. The interrupt-handling flow should be to read the Root Port Interrupt FIFO Read 1 register first, immediately followed by this register. For non-Root Port cores, reads return 0. For INTx interrupts, reads return zero.

Note: Reads are non-destructive. Removing the message from the FIFO requires a write to either this register or the Root Port Interrupt FIFO Read 1 register (write value is ignored).

Bits	Name	Core Access	Reset Value	Description
15:0	Message Data	RWC	0	Payload for MSI messages.
31:16	Reserved	RO	0	Reserved

Table 2-21: Root Port Interrupt FIFO Read Register 2

VSEC Capability Register 2 (Offset 0x200)

The VSEC capability register (described in Table 2-22) allows the memory space for the core to appear as though it is a part of the underlying integrated block PCIe configuration space. The VSEC is inserted immediately following the last enhanced capability structure in the underlying block. VSEC is defined in §7.18 of the PCI Express Base Specification, v1.1 (§7.19 of v2.0) [Ref 5].

This register is only included if C_INCLUDE_BAR_OFFSET_REG = 1.

Table 2-22:VSEC Capability Register 2

Bits	Name	Core Access	Reset Value	Description
15:0	VSEC Capability ID	RO	0x000B	PCI-SIG defined ID identifying this Enhanced Capability as a Vendor-Specific capability. Hardcoded to 0x000B.
19:16	Capability Version	RO	0x1	Version of this capability structure. Hardcoded to 0x1.
31:20	Next Capability Offset	RO	0x000	Offset to next capability.

VSEC Header Register 2 (Offset 0x204)

The VSEC Header Register 2 (described in Table 2-23) provides a unique (within a given vendor) identifier for the layout and contents of the VSEC structure, as well as its revision and length.

This register is only included if C_INCLUDE_BAR_OFFSET_REG = 1.

Table 2-23:VSEC Header Register 2

Bits	Name	Core Access	Reset Value	Description
15:0	VSEC ID	RO	0x0002	ID value uniquely identifying the nature and format of this VSEC structure.
19:16	VSEC REV	RO	0x0	Version of this capability structure. Hardcoded to 0x0.
31:20	VSEC Length	RO	0x038	Length of the entire VSEC Capability structure, in bytes, including the VSEC Capability register. Hardcoded to 0x038 (56 decimal).

AXI Base Address Translation Configuration Registers (Offset 0x208 - 0x234)

The AXI Base Address Translation Configuration Registers and their offsets are shown in Table 2-24 and the register bits are described in Table 2-25. This set of registers can be used in two configurations based on the top-level parameter C_AXIBAR_AS_n. When the BAR is set to a 32-bit address space, then the translation vector should be placed into the AXIBAR2PCIEBAR_nL register where n is the BAR number. When the BAR is set to a 64-bit address space, then the most significant 32 bits are written into the AXIBAR2PCIEBAR_nU and the least significant 32 bits are written into AXIBAR2PCIEBAR_nL. These registers are only included if C_INCLUDE_BAR_OFFSET_REG = 1.

Offset	Bits	Register Mnemonic
0x208	31-0	AXIBAR2PCIEBAR_0U
0x20C	31-0	AXIBAR2PCIEBAR_0L
0x210	31-0	AXIBAR2PCIEBAR_1U
0x214	31-0	AXIBAR2PCIEBAR_1L
0x218	31-0	AXIBAR2PCIEBAR_2U
0x21C	31-0	AXIBAR2PCIEBAR_2L
0x220	31-0	AXIBAR2PCIEBAR_3U
0x224	31-0	AXIBAR2PCIEBAR_3L
0x228	31-0	AXIBAR2PCIEBAR_4U
0x22C	31-0	AXIBAR2PCIEBAR_4L
0x230	31-0	AXIBAR2PCIEBAR_5U
0x234	31-0	AXIBAR2PCIEBAR_5L

Table 2-24: AXI Base Address Translation Configuration Registers

Bits	Name	Core Access	Reset Value	Description

Table 2-25: AXI Base Address Translation Configuration Register Bit Definitions (Cont'd)

Enhanced Configuration Access

When the AXI Bridge for PCI Express core is configured as a Root Port, configuration traffic is generated by using the PCI Express Enhanced Configuration Access Mechanism (ECAM). ECAM functionality is available only when the core is configured as a Root Port. Reads and writes to a certain memory aperture are translated to configuration reads and writes, as specified in the PCI Express Base Specification (v1.1 and v2.1), §7.2.2 [Ref 5].

Depending on the core configuration, the ECAM memory aperture is $2^{21}-2^{28}$ (byte) addresses. The address breakdown is defined in Table 2-26. The ECAM window begins at memory map base address and extends to $2^{(20+ECAM_SIZE)} - 1$. ECAM_SIZE is calculated from the C_BASEADDR and C_HIGHADDR parameters. The number N of low-order bits of the two parameters that do not match, specifies the 2**n byte address range of the ECAM space. If C_INCLUDE_RC = 0, then ECAM_SIZE = 0.

When an ECAM access is attempted to the primary bus number, which defaults as bus 0 from reset, then access to the type 1 PCI[™] Configuration Header of the integrated block in the Enhanced Interface for PCIe is performed. When an ECAM access is attempted to the secondary bus number, then type 0 configuration transactions are generated. When an ECAM access is attempted to a bus number that is in the range defined by the secondary bus number and subordinate bus number (not including the secondary bus number), then type 1 configuration transactions are generated. The primary, secondary, and subordinate bus numbers are written by Root Port software to the type 1 PCI Configuration Header of the Enhanced Interface for PCIe in the beginning of the enumeration procedure.

When an ECAM access is attempted to a bus number that is out of the bus_number and subordinate bus number, the bridge does not generate a configuration request and signal

SLVERR response on the AXI4-Lite bus. When the AXI Bridge for PCIe is configured for EP (C_INCLUDE_RC = 0), the underlying Integrated Block configuration space and the core memory map are available at the beginning of the memory space. The memory space looks like a simple PCI Express configuration space. When the AXI Bridge for PCIe is configured for RC (C_INCLUDE_RC = 1), the same is true, but it also looks like an ECAM access to primary bus, Device 0, Function 0.

When the AXI Bridge for PCI Express core is configured as a Root Port, the reads and writes of the local ECAM are Bus 0. Because the FPGA only has a single Integrated Block for PCIe core, all local ECAM operations to Bus 0 return the ECAM data for Device 0, Function 0.

Configuration write accesses across the PCI Express bus are non-posted writes and block the AXI4-Lite interface while they are in progress. Because of this, system software is not able to service an interrupt if one were to occur. However, interrupts due to abnormal terminations of configuration transactions can generate interrupts. ECAM read transactions block subsequent Requester read TLPs until the configuration read completions packet is returned to allow unique identification of the completion packet.

Bits	Name	Description		
1:0	Byte Address	Ignored for this implementation. The S_AXI_CTL_WSTRB[3:0] signals define byte enables for ECAM accesses.		
7:2	Register Number	Register within the configuration space to access.		
11:8	Extended Register Number	Along with Register Number, allows access to PCI Express Extended Configuration Space.		
14:12	Function Number	Function Number to completer.		
19:15	Device Number	Device Number to completer.		
(20+n-1):20	Bus Number	Bus Number, $1 \le n \le 8$. <i>n</i> is the number of bits available for Bus Number as derived from core parameters C_INCLUDE_RC, C_BASEADDR, and C_HIGHADDR.		

Unsupported Memory Space

Advanced Error Reporting (AER) is not supported in the AXI Bridge for PCI Express core. The AER register space is not accessible in the AXI Bridge for PCI Express memory mapped space.

Designing with the Core

This chapter includes guidelines and additional information to make designing with the core easier.

General Design Guidelines

The Vivado® Design Suite has been optimized to provide a starting point for designing with the AXI Bridge for PCI Express® core.

Clocking

Figure 3-1 shows the clocking diagram for the core. The axi_aclk_out output must be fed back and used as the input for axi_aclk. This is the main memory-mapped AXI4 bus clock.

Figure 3-1: Clocking Diagram

The refclk input must be provided at the frequency selected by the value of c_ref_clk_freq. This clock is used to generate the two output clocks and is also the clock used to drive the AXI4 bus.

www.xilinx.com

The axi_ctl_aclk_out output must be fed back and used for the input axi_ctl_aclk. This is the AXI4-Lite interconnect clock. The axi_ctl_aclk_out clock is rising edge aligned and an integer division of the axi_aclk_out clock.

Resets

The AXI Bridge for PCI Express core is designed to be used with the Processing System Reset module for generation of the axi_areset input. When using the Vivado IP integrator to build a system, it is best to connect the perstn pin of the host connector for PCIe to the Peripheral_Reset port of the Processing System Reset module. The bridge does not use PERSTN directly. Also, the mmcm_lock output must be connected to the dcm_locked input of the Processing System Reset module to make sure that axi_areset is held active for 16 clocks after mmcm_lock becomes active. See Figure 3-2.

Note: Be sure to set the correct polarity on the aux_reset_in signal of the proc_sys_reset ip block. when PERSTN is active-Low, set the parameter as follows:

Figure 3-2: System Reset Connection

Shared Logic

This new feature allows you to share common blocks across multiple instantiations. It minimizes the amount of required HDL modifications. You can use your own system level clocking or reset circuit. You can modify some of these blocks due to system requirements (for example, swapping a BUFG for a BUFH). You can instantiate multiple cores and share

'common/shared logic' from one core among all instantiated cores. This is only applicable for Endpoint mode, and not Root Port mode.

In the Vivado Design Suite, the shared logic options are available in the **Shared Logic** page when customizing the core.

There are four types of logic sharing:

- Shared Clocking
- Shared GT_COMMON
- Shared GT_COMMON and Clocking
- Internal Shared GT_COMMON and Clocking

Shared Clocking

To use the share clocking feature, select **Include Shared Logic (Clocking) in example design** option in the in the Shared Logic tab (Figure 3-3).

When this feature is selected, the mixed-mode clock manager (MMCM) instance is removed from the pipe wrappers and is moved into the support wrapper of the example design. It also brings out additional ports to the top level to enable sharing of the clocks.

You also have the option to modify and use the unused outputs of the MMCM.

Figure 3-3: Shared Clocking

The MMCM generates the following clocks for PCIe solution wrapper:

- clk_125mhz 125 MHz clock.
- clk_250mhz 250 MHz clock.
- userclk 62.5 MHz / 125 MHz / 250 MHz clock, depending on selected PCIe core lane width, link speed, and AXI interface width.
- userclk2 250 MHz / 500 MHz clock, depending on selected PCIe core link speed.
- oobclk 50 MHz clock.

The other cores/logic present in the user design can use any of the MMCM outputs listed above.

The MMCM instantiated in the PCIe example design has two unconnected outputs: CLKOUT5, and CLKOUT6. You can use those outputs to generate other desired clock

frequencies by selecting the appropriate CLKOUT5_DIVIDE and CLKOUT6_DIVIDE parameters for MMCM.

TIP: Sharing the MMCM between PCIe and other cores in your design saves FPGA resources and eases output clock path routing.

Limitations

- Reference clock input to MMCM is restricted to 100 MHz in most use cases.
 - There is an option for selecting a reference clock of 125MHz or 250MHz, which is not a common use case.
- The MMCM reset is tied to a static value in the top module. The MMCM can be reset as required by the system design. Note that MMCM reset can be asserted only after reference clock is recovered and is stable. Also, MMCM reset is indirectly tied to the PCIe core reset and asserting MMCM reset will reset the PCIe core.
- Userclk1 and Userclk2 outputs are selected based on the **PCIe Lane Width**, **Link Speed**, and **AXI width** selections (for details, see Customizing the Core in Chapter 4). Sharing cores must comply with these requirements.

Shared GT_COMMON

A quad phase-locked loop (QPLL) in GT_COMMON can serve a quad of GT_CHANNEL instances. If the PCIe core is configured as X1 or X2 and is using a QPLL, the remaining GT_CHANNEL instances can be used by other cores by sharing the same QPLL and GT_COMMON.

To share GT_COMMON instances, select **Include Shared Logic (Transceiver GT_COMMON) in example design** option in the Shared Logic tab(Figure 3-4).

When this feature is selected, the GT_COMMON instance is removed from the pipe wrappers and is moved into the support wrapper of the example design. It also brings out additional ports to the top level to enable sharing of the GT_COMMON.

Shared logic feature for GT_COMMON helps save FPGA resources and also eases dedicated clock routing within the single GT Quad.

Shared GT_COMMON Use Cases with GTX and GTP

GT – PCle max Link Speed	Device – PCIe Max Link Speed	Shared GT_COMMON
GTX	Kintex7, Virtex7 (485T) – PCIe Gen2	PCIe Pipe Wrappers instantiate GT_COMMON . Shared IP uses QPLL because PCIe uses CPLL inside GT_CHANNEL
GTP	Artix7 – PCIe Gen2	GTP_COMMON has 2 QPLLs. PCIe Pipe Wrappers will only use one QPLL. Remaining one can be used by shared IP core.

Limitations

- The reset logic in the pipe wrapper resets the QPLL when the PCIe Block performs a rate change. When sharing is enabled, the core/logic which is sharing the QPLL must be able to handle and recover from this reset.
- The settings of the GT_COMMON should not be changed as they are optimized for the PCIe core.

Figure 3-4: Shared GT_COMMON

Shared GT_COMMON and Clocking

You can share both GT_COMMON and Clocking instances when you select **Include Shared Logic (Clocking) in example design** and **Include Shared Logic (Transceiver GT_COMMON) in example design** in the Shared Logic page (see Figure 3-5).

Clocking Interface

Table 3-2 defines the clocking interface signals.

Name	Direction	Description	
pipe_pclk_in	Input	Parallel clock used to synchronize data transfers across the parallel interface of the GTX transceiver.	
pipe_rxusrclk_in	Input	Provides a clock for the internal RX PCS datapath.	
pipe_rxoutclk_in	Input	Recommended clock output to the FPGA logic.	
pipe_dclk_in	Input	Dynamic reconfiguration clock.	
pipe_userclk1_in	Input	Optional user clock.	
pipe_userclk2_in	Input	Optional user clock.	
pipe_mmcm_lock_in	Input	Indicates if the MMCM is locked onto the source CLK.	
pipe_txoutclk_out	Output	Recommended clock output to the FPGA logic.	
pipe_rxoutclk_out	Output	Recommended clock output to the FPGA logic.	
pipe_pclk_sel_out	Output	Parallel clock select.	
pipe_gen3_out	Output	Indicates the PCI Express operating speed.	
pipe_mmcm_rst_n		MMCM reset port. This port could be used by the upper layer to reset MMCM if error recovery is required. If the system detects the deassertion of MMCM lock, Xilinx recommends that you reset the MMCM. The recommended approach is to reset the MMCM after the MMCM input clock recovers (if MMCM reset occurs before the input reference clock recovers, the MMCM might never relock). After MMCM is reset, wait for MMCM to lock and then reset the PIPE Wrapper as normally done. Currently this port is tied High.	

The Clocking architecture is described in detail in the Use Model chapter of the 7 Series FPGAs GTX/GTH Transceivers User Guide (UG476) [Ref 3].

AXI Transactions for PCIe

Table 3-3 and Table 3-4 are the translation tables for AXI4-Stream and memory-mapped transactions.

Table 3-3: AXI4 Memory-Mapped Transactions to AXI4-Stream PCIe TLPs

AXI4 Memory-Mapped Transaction	AXI4-Stream PCIe TLPs
INCR Burst Read of 32-bit address AXIBAR	MemRd 32 (3DW)
INCR Burst Write to 32-bit address AXIBAR	MemWr 32 (3DW)

AXI4 Memory-Mapped Transaction	AXI4-Stream PCIe TLPs
INCR Burst Read of 32-bit address AXIBAR	MemRd 64 (4DW)
INCR Burst Write to 32-bit address AXIBAR	MemWr 64 (4DW)

Table 3-4: AXI4-Stream PCIe TLPs to AXI4 Memory Mapped Transactions

AXI4-Stream PCIe TLPs	AXI4 Memory-Mapped Transaction
MemRd 32 (3DW) of PCIEBAR	INCR Burst Read with 32-bit address
MemWr 32 (3DW) to PCIEBAR	INCR Burst Write with 32-bit address
MemRd 64 (4DW) of PCIEBAR	INCR Burst Read with 32-bit address
MemWr 64 (4DW) to PCIEBAR	INCR Burst Write with 32-bit address

Transaction Ordering for PCIe

The AXI Bridge for PCI Express core conforms to strict PCIe transaction ordering rules. See the PCIe v2.1 Specification [Ref 5] for the complete rule set. The following behaviors are implemented in the AXI Bridge for PCI Express core to enforce the PCIe transaction ordering rules on the highly-parallel AXI bus of the bridge. The rules are enforced without regard to the Relaxed Ordering attribute bit within the TLP header:

- The bresp to the remote (requesting) AXI4 master device for a write to a remote PCIe device is not issued until the MemWr TLP transmission is guaranteed to be sent on the PCIe link before any subsequent tx-transfers.
- A remote AXI master read of a remote PCIe device is not permitted to pass any previous or simultaneous AXI master writes to a remote PCIe device that occurs previously or at the same time. Timing is based off the AXI arvalid signal timing relative to the AXI awvalid. Any AXI write transaction in which awvalid was asserted before or at the same time as the arvalid for a read from pcie is asserted causes the MemRd TLP(s) to be held until the pipelined or simultaneous MemWr TLP(s) have been sent.
- A remote PCIe device read of a remote AXI slave is not permitted to pass any previous remote PCIe device writes to a remote AXI slave received by the AXI Bridge for PCI Express core. The AXI read address phase is held until the previous AXI write transactions have completed and bresp has been received for the AXI write transactions.
- Read completion data received from a remote PCIe device are not permitted to pass any remote PCIe device writes to a remote AXI slave received by the AXI Bridge for PCI Express core prior to the read completion data. The bresp for the AXI write(s) must be received before the completion data is presented on the AXI read data channel.
- Read data from a remote AXI slave is not permitted to pass any remote AXI master writes to a remote PCIe device initiated on the AXI bus prior to or simultaneously with

the read data being returned on the AXI bus. Timing is based off the AXI awvalid signal timing relative to the AXI rvalid assertion. Any AXI write transaction in which awvalid was asserted before or simultaneously with the rvalid being asserted up to and including the last data beat, causes the Completion TLP(s) to be held until the pipelined or simultaneous MemWr TLP(s) have been sent.

IMPORTANT: The transaction ordering rules for PCIe have an impact on data throughput in heavy bidirectional traffic.

Address Translation

The address space for PCIe is different than AXI address space. To access one address space from another address space requires an address translation process. On the AXI side, the bridge supports mapping to PCIe on up to six 32-bit or 64-bit AXI base address registers (BARs). The generics used to configure the BARs follow.

C_AXIBAR_NUM, C_AXIBAR_n, C_AXIBAR_HIGHADDR_n, C_AXIBAR2PCIEBAR_n and C_AXIBAR_AS_n,

where *n* represents an AXIBAR number from 0 to 5. The bridge for PCIe supports mapping on up to three 64-bit BARs for PCIe. The generics used to configure the BARs are:

C_PCIEBAR_NUM, C_PCIE2AXIBAR_n and C_PCIEBAR_LEN_n,

where *n* represents a particular BAR number for PCIe from 0 to 2.

Note: The C_INCLUDE_BAROFFSET_REG generic allows for dynamic address translation. When this parameter is set to one, the AXIBAR2PCIEBAR_n translation vectors can be changed by using the software.

Four examples follow:

- Example 1 (32-bit PCIe Address Mapping) demonstrates how to set up four 32-bit AXI BARs and translate the AXI address to an address for PCIe.
- Example 2 (64-bit PCIe Address Mapping) demonstrates how to set up three 64-bit AXI BARs and translate the AXI address to an address for PCIe.
- Example 3 demonstrates how to set up two 64-bit PCIe BARs and translate the address for PCIe to an AXI address.
- Example 4 demonstrates how set up a combination of two 32-bit AXI BARs and two 64 bit AXI BARs, and translate the AXI address to an address for PCIe.

Example 1 (32-bit PCIe Address Mapping)

This example shows the generic settings to set up four independent 32-bit AXI BARs and address translation of AXI addresses to a remote address space for PCIe. This setting of AXI BARs does not depend on the BARs for PCIe within the AXI Bridge for PCI Express core.

In this example, where C_AXIBAR_NUM=4, the following assignments for each range are made:

```
C_AXIBAR_AS_0=0
C_AXIBAR_0=0x12340000
C_AXI_HIGHADDR_0=0x1234FFF
C_AXIBAR2PCIEBAR_0=0x5671XXXX (Bits 15-0 do not matter as the lower 16-bits hold the
actual lower 16-bits of the PCIe address)
C_AXIBAR_AS_1=0
C_AXIBAR_1=0xABCDE000
C_AXI_HIGHADDR_1=0xABCDFFFF
C_AXIBAR2PCIEBAR_1=0xFEDC0XXX (Bits 12-0 do not matter as the lower 13-bits hold the
actual lower 13-bits of the PCIe address)
```

```
C_AXIBAR_AS_2=0
C_AXIBAR_2=0xFE000000
C_AXI_HIGHADDR_2=0xFFFFFFF
C_AXIBAR2PCIEBAR_2=0x40XXXXXX (Bits 24-0 do not care)
```

• Accessing the Bridge AXIBAR_0 with address 0x12340ABC on the AXI bus yields 0x56710ABC on the bus for PCIe.

Figure 3-7: AXI to PCIe Address Translation

- Accessing the Bridge AXIBAR_1 with address 0xABCDF123 on the AXI bus yields 0xFEDC1123 on the bus for PCIe.
- Accessing the Bridge AXIBAR_2 with address 0xFFFEDCBA on the AXI bus yields 0x41FEDCBA on the bus for PCIe.

Example 2 (64-bit PCIe Address Mapping)

This example shows the generic settings to set up to three independent 64-bit AXI BARs and address translation of AXI addresses to a remote address space for PCIe. This setting of AXI BARs does not depend on the BARs for PCIe within the Bridge.

In this example, where C_AXIBAR_NUM=3, the following assignments for each range are made:

```
C_AXIBAR_AS_0=1

C_AXIBAR_0=0x12340000

C_AXI_HIGHADDR_0=0x1234FFFF

C_AXIBAR2PCIEBAR_0=0x50000005671XXXX (Bits 15-0 do not matter)

C_AXIBAR_AS_1=1

C_AXIBAR_1=0xABCDE000

C_AXI_HIGHADDR_1=0xABCDFFFF

C_AXIBAR2PCIEBAR_1=0x6000000FEDC0XXX (Bits 12-0 do not matter)

C_AXIBAR_AS_2=1

C_AXIBAR_AS_2=1

C_AXIBAR_2=0xFE000000

C_AXI_HIGHADDR_2=0xFFFFFFF
```

- C_AXIBAR2PCIEBAR_2=0x700000040XXXXXX (Bits 24-0 do not matter)
- Accessing the Bridge AXIBAR_0 with address 0x12340ABC on the AXI bus yields 0x500000056710ABC on the bus for PCIe.
- Accessing the Bridge AXIBAR_1 with address 0xABCDF123 on the AXI bus yields 0x6000000FEDC1123 on the bus for PCIe.
- Accessing the Bridge AXIBAR_2 with address 0xFFFEDCBA on the AXI bus yields 0x700000041FEDCBA on the bus for PCIe.

Example 3

This example shows the generic settings to set up two independent BARs for PCIe and address translation of addresses for PCIe to a remote AXI address space. This setting of BARs for PCIe does not depend on the AXI BARs within the bridge.

In this example, where C_PCIEBAR_NUM=2, the following range assignments are made:

```
BAR 0 is set to 0x2000000_ABCD8000 by the Root Port
C_PCIEBAR_LEN_0=15
C_PCIEBAR2AXIBAR_0=0x1234_0XXX (Bits 14-0 do not matter)
BAR 1 is set to 0xA00000012000000 by Root Port
C_PCIEBAR_LEN_1=25
C_PCIEBAR2AXIBAR_1=0xFEXXXXXX (Bits 24-0 do not matter)
```

• Accessing the Bridge PCIEBAR_0 with address 0x2000000_ABCDFFF4 on the bus for PCIe yields 0x1234_7FF4 on the AXI bus.

Figure 3-8: PCIe to AXI Translation

Accessing Bridge PCIEBAR_1 with address 0xA0000001235FEDC on the bus for PCIe yields 0xFE35FEDC on the AXI bus.

Example 4

This example shows the generic settings to set up a combination of two independent 32-bit AXI BARs and two independent 64-bit BARs and address translation of AXI addresses to a remote address space for PCIe. This setting of AXI BARs does not depend on the BARs for PCIe within the Bridge.

In this example, where C_AXIBAR_NUM=4, the following assignments for each range are made:

```
C_AXIBAR_AS_0=0
C_AXIBAR_0=0x12340000
C AXI HIGHADDR 0=0x1234FFFF
C_AXIBAR2PCIEBAR_0=0x5671XXXX (Bits 15-0 do not matter)
C_AXIBAR_AS_1=1
C_AXIBAR_1=0xABCDE000
C_AXI_HIGHADDR_1=0xABCDFFFF
C_AXIBAR2PCIEBAR_1=0x5000000FEDC0XXX (Bits 12-0 do not matter)
C_AXIBAR_AS_2=0
C_AXIBAR_2=0xFE000000
C_AXI_HIGHADDR_2=0xFFFFFFFF
C_AXIBAR2PCIEBAR_2=0x40XXXXXX (Bits 24-0 do not matter)
C_AXIBAR_AS_3=1
C_AXIBAR_3=0x0000000
C_AXI_HIGHADDR_3=0x000007F
C_AXIBAR2PCIEBAR_3=0x60000008765438X (Bits 6-0 do not matter)
```

www.xilinx.com

- Accessing the Bridge AXIBAR_0 with address 0x12340ABC on the AXI bus yields 0x56710ABC on the bus for PCIe.
- Accessing the Bridge AXIBAR_1 with address 0xABCDF123 on the AXI bus yields 0x5000000FEDC1123 on the bus for PCIe.
- Accessing the Bridge AXIBAR_2 with address 0xFFFEDCBA on the AXI bus yields 0x41FEDCBA on the bus for PCIe.
- Accessing the AXI M S PCIe Bridge AXIBAR_3 with address 0x00000071 on the AXI bus yields 0x6000000876543F1 on the bus for PCIe.

Addressing Checks

When setting the following parameters for PCIe address mapping, C_PCIE2AXIBAR_n and C_PCIEBAR_LEN_n, be sure these are set to allow for the 32-bit addressing space on the AXI system. For example, the following setting is illegal and results in an invalid AXI address.

C_PCIE2AXIBAR_0 = 0xFFFF_0000 C_PCIEBAR_LEN_0 = 23

Also, check for a larger value on C_PCIEBAR_LEN_n compared to the value assigned to parameter, C_PCIE2AXIBAR_n. For example, the following parameter settings.

```
C_PCIE2AXIBAR_0 = 0xFFFF_E000
C_PCIEBAR_LEN_0 = 20
```

To keep the AXIBAR upper address bits as 0xFFFF_E000 (to reference bits [31:13]), the C_PCIEBAR_LEN_0 parameter must be set to 13.

Interrupts

This section describes the interrupt pins which include Local, MSI and Legacy Interrupts.

Local Interrupts

The INTERRUPT_OUT pin can be configured to send interrupts based on the settings of the Interrupt Mask register. The INTERRUPT_OUT pin signals interrupts to devices attached to the memory mapped AXI4 side of the Bridge. The MSI interrupt defined in the Interrupt Mask & Interrupt Decode registers is used to indicate the receipt of a Message Signaled Interrupt only when the bridge is operating in Root Port mode (C_INCLUDE_RC=1).

MSI Interrupt

When the MSI_enable output pin indicates that the bridge has Endpoint MSI functionality enabled (MSI_enable = '1'), the intx_msi_request input pin is defined as MSI_Request and can be used to trigger a Message Signaled Interrupt through a special MemWr TLP to an external Root Port for PCIe on the PCIe side of the Bridge. The intx_msi_request input pin is positive-edge detected and synchronous to axi_aclk. The address and data contained in this MemWr TLP are determined by an external Root Port for PCIe configuration of registers within the integrated block for PCI Express. The Intx_msi_request pin input is valid only when the bridge is operating in Endpoint mode (C_INCLUDE_RC=0).

Additional MSI capability now supports multiple vectors on the Endpoint configuration of the AXI Bridge for PCI Express core. Using the handshaking described here, an additional input value specifies the vector number to send with the MSI MemWr TLP upstream to the Root Port. This is specified on the input signal, msi_vector_num. This signal is (4:0), and represents up to (32), the allowable MSI messages that can be sent from the Endpoint (and what is enabled after configuration).

The bridge ignores any bits set on the msi_vector_num input signal, if they are not allocated in the Message Control Register.

The Endpoint requests the number of message as specified in the design parameter (of the AXI Bridge for PCI Express), C_NUM_MSI_REQ. Following specification requirements, this parameter can be set up to 5. C_NUM_MSI_REQ represents the number of MSI vectors requested. For example, C_NUM_MSI_REQ = 5 represents a request of $2^5 = 32$ MSI vectors. This parameter value, C_NUM_MSI_REQ is assigned to the Message Control Register field, Multiple Message Capable, bits (3:1).

After configuration, the number of allocated MSI vectors is specified in the design output port, msi_vector_width. This signal with width, (2:0), can only be values up to 5 ("101"), representing 32 allocated MSI vectors for the Endpoint. Output values of 6 and 7; "110" and "111" are reserved. The msi_vector_width output signal is a direct correlation from the value in the Multiple Message Enable field bits (6:4) of the Message Control Register as shown in Table 3-5.

Value	Number of Messages Requested	Output Signal, MSI_Vector_Width (2:0)	
"000"	1	"000"	
"001"	2	"001"	
"010"	4	"010"	
"011"	8	"011"	
"100"	16	"100"	
"101"	32	"101"	

Table 3-5: MSI Vectors Enabled in Message Control Register

Value	Number of Messages Requested	Output Signal, MSI_Vector_Width (2:0)
"110"	Reserved	N/A
"111"	Reserved	N/A

Additional IP is required in the Endpoint PCIe system to create the prioritization scheme for the MSI vectors on the PCIe interface.

Legacy Interrupts

The bridge supports legacy interrupts for PCI if selected by the C_INTERRUPT_PIN parameter. (Can only be set to 1 when C_INCLUDE_RC = 0.) A value of 1 selects INTA, as defined in Table 2-4. If a legacy interrupt for PCI support is selected and the msi_enable output pin indicates that the bridge has endpoint MSI functionality disabled (MSI_enable = '0'), the intx_msi_request pin is defined as intx. When the intx pin goes High, an assert INTA message is sent. When the INTX pin goes Low, a deassert INTA message is sent. These messages are defined in the PCI 2.1 specification. The intx_msi_request pin input is valid only when the bridge is operating in Endpoint mode (C_INCLUDE_RC=0).

Malformed TLP

The integrated block for PCIe Express detects a malformed TLP. For the IP configured as an Endpoint core, a malformed TLP results in a fatal error message being sent upstream if error reporting is enabled in the Device Control Register.

For the IP configured as a Root Port, when a malformed TLP is received from the Endpoint, this can fall under one of several types of violations as per the PCIe specification. For example, if a Received TLP has the Error Poison bit set, this is discarded by the MM/S master bridge, and the MEP (Master Error Poison) bit is set in the Interrupt Decode register.

Abnormal Conditions

This section describes how the Slave side (Table 3-6) and Master side (Table 3-7) of the AXI Bridge for PCI Express core handle abnormal conditions.

Slave Bridge Abnormal Conditions

Slave Bridge abnormal conditions are classified as: Illegal Burst Type and Completion TLP Errors. The following sections describe the manner in which the Bridge handles these errors.

Illegal Burst Type

The Slave Bridge monitors AXI read and write burst type inputs to ensure that only the INCR (incrementing burst) type is requested. Any other value on these inputs is treated as an error condition and the Slave Illegal Burst (SIB) interrupt is asserted. In the case of a read request, the Bridge asserts SLVERR for all data beats and arbitrary data is placed on the S_AXI_RDATA bus. In the case of a write request, the Bridge asserts SLVERR for the write response and all write data is discarded.

Completion TLP Errors

Any request to the bus for PCIe (except for posted Memory write) requires a completion TLP to complete the associated AXI request. The Slave side of the Bridge checks the received completion TLPs for errors and checks for completion TLPs that are never returned (Completion Timeout). Each of the completion TLP error types are discussed in the subsequent sections.

Unexpected Completion

When the Slave Bridge receives a completion TLP, it matches the header RequesterID and Tag to the outstanding RequesterID and Tag. A match failure indicates the TLP is an Unexpected Completion which results in the completion TLP being discarded and a Slave Unexpected Completion (SUC) interrupt strobe being asserted. Normal operation then continues.

Unsupported Request

A device for PCIe might not be capable of satisfying a specific read request. For example, the read request targets an unsupported address for PCIe causing the completer to return a completion TLP with a completion status of "0b001 - Unsupported Request". The completer can also return a completion TLP with a completion status that is "reserved" according to the 2.1 PCIe Specification, which must be treated as an unsupported request status. When the slave bridge receives an unsupported request response, the Slave Unsupported Request (SUR) interrupt is asserted and the SLVERR response is asserted with arbitrary data on the memory mapped AXI4 bus.

Completion Timeout

A Completion Timeout occurs when a completion (Cpl) or completion with data (CplD) TLP is not returned after an AXI to PCIe read request. Completions must complete within the C_COMP_TIMEOUT parameter selected value from the time the MemRd for PCIe request is issued. When a completion timeout occurs, a Slave Completion Timeout (SCT) interrupt is asserted and the SLVERR response is asserted with arbitrary data on the memory mapped AXI4 bus.

Poison Bit Received on Completion Packet

An Error Poison occurs when the completion TLP "EP" bit is set, indicating that there is poisoned data in the payload. When the slave bridge detects the poisoned packet, the Slave Error Poison (SEP) interrupt is asserted and the SLVERR response is asserted with arbitrary data on the memory mapped AXI4 bus.

Completer Abort

A Completer Abort occurs when the completion TLP completion status is "0b100 -Completer Abort". This indicates that the completer has encountered a state in which it was unable to complete the transaction. When the slave bridge receives a completer abort response, the Slave Completer Abort (SCA) interrupt is asserted and the SLVERR response is asserted with arbitrary data on the memory mapped AXI4 bus.

Table 3-6: Slave Bridge Response to Abnormal Conditions

Transfer Type	Abnormal Condition	Bridge Response	
Read	Illegal burst type	SIB interrupt is asserted. SLVERR response given with arbitrary read data.	
Write	Illegal burst type	SIB interrupt is asserted. Write data is discarded. SLVERR response given.	
Read	Unexpected completion	SUC interrupt is asserted. Completion is discarded.	
Read	Unsupported Request status returned	SUR interrupt is asserted. SLVERR response given with arbitrary read data.	
Read	Completion timeout	SCT interrupt is asserted. SLVERR response given with arbitrary read data.	
Read	Poison bit in completion	Completion data is discarded. SEP interrupt is asserted. SLVERR response given with arbitrary read data.	
Read	Completer Abort (CA) status returned	SCA interrupt is asserted. SLVERR response given with arbitrary read data.	

Master Bridge Abnormal Conditions

The following sections describe the manner in which the Master Bridge handles abnormal conditions.

AXI DECERR Response

When the Master Bridge receives a DECERR response from the AXI bus, the request is discarded and the Master DECERR (MDE) interrupt is asserted. If the request was non-posted, a completion packet with the Completion Status = Unsupported Request (UR) is returned on the bus for PCIe.

AXI SLVERR Response

When the Master Bridge receives a SLVERR response from the addressed AXI slave, the request is discarded and the Master SLVERR (MSE) interrupt is asserted. If the request was non-posted, a completion packet with the Completion Status = Completer Abort (CA) is returned on the bus for PCIe.

Max Payload Size for PCIe, Max Read Request Size or 4K Page Violated

It is the responsibility of the requester to ensure that the outbound request adhere to the Max Payload Size, Max Read Request Size, and 4 Kb Page Violation rules. If the master bridge receives a request that violates one of these rules, the bridge processes the invalid request as a valid request, which can return a completion that violates one of these conditions or can result in the loss of data. The Master Bridge does not return a malformed TLP completion to signal this violation.

Completion Packets

When the MAX_READ_REQUEST_SIZE is greater than the MAX_PAYLOAD_SIZE, a read request for PCIe can ask for more data than the Master Bridge can insert into a single completion packet. When this situation occurs, multiple completion packets are generated up to MAX_PAYLOAD_SIZE, with the Read Completion Boundary (RCB) observed.

Poison Bit

When the poison bit is set in a transaction layer packet (TLP) header, the payload following the header is corrupt. When the Master Bridge receives a memory request TLP with the poison bit set, it discards the TLP and asserts the Master Error Poison (MEP) interrupt strobe.

Zero Length Requests

When the Master Bridge receives a read request with the Length = 0x1, FirstBE = 0x00, and LastBE = 0x00, it responds by sending a completion with Status = Successful Completion. When the Master Bridge receives a write request with the Length = 0x1, FirstBE = 0x00, and LastBE = 0x00 there is no effect.

Transfer Type	Abnormal Condition	Bridge Response
Read	DECERR response	MDE interrupt strobe asserted Completion returned with Unsupported Request status
Write	DECERR response	MDE interrupt strobe asserted
Read	SLVERR response	MSE interrupt strobe asserted Completion returned with Completer Abort status
Write	SLVERR response	MSE interrupt strobe asserted
Write	Poison bit set in request	MEP interrupt strobe asserted Data is discarded
Read	DECERR response	MDE interrupt strobe asserted Completion returned with Unsupported Request status
Write	DECERR response	MDE interrupt strobe asserted

 Table 3-7:
 Master Bridge Response to Abnormal Conditions

Link Down Behavior

The normal operation of the AXI Bridge for PCI Express core is dependent on the Integrated Block for PCIe establishing and maintaining the point-to-point link with an external device for PCIe. If the link has been lost, it must be re-established to return to normal operation.

When a Hot Reset is received by the AXI Bridge for PCI Express core, the link goes down and the PCI Configuration Space must be reconfigured.

Initiated AXI4 write transactions that have not yet completed on the AXI4 bus when the link goes down have a SLVERR response given and the write data is discarded. Initiated AXI4 read transactions that have not yet completed on the AXI4 bus when the link goes down have a SLVERR response given, with arbitrary read data returned.

Any MemWr TLPs for PCIe that have been received, but the associated AXI4 write transaction has not started when the link goes down, are discarded. If the associated AXI4 write transaction is in the process of being transferred, it completes as normal. Any MemRd TLPs for PCIe that have been received, but have not returned completion TLPs by the time the link goes down, complete on the AXI4 bus, but do not return completion TLPs on the PCIe bus.

Root Port

When configured to support Root Port functionality, the AXI Bridge for PCI Express core fully supports Root Port operation as supported by the underlying block. There are a few details that need special consideration. The following subsections contain information and design considerations about Root Port support.

Power Limit Message TLP

The AXI Bridge for PCI Express core automatically sends a Power Limit Message TLP when the Master Enable bit of the Command Register is set. The software must set the Requester ID register before setting the Master Enable bit to ensure that the desired Requester ID is used in the Message TLP.

Root Port Configuration Read

When an ECAM access is performed to the primary bus number, self-configuration of the integrated block for PCIe is performed. A PCIe configuration transaction is not performed and is not presented on the link. When an ECAM access is performed to the bus number that is equal to the secondary bus value in the Enhanced PCIe type 1 configuration header, then type 0 configuration transactions are generated.

When an ECAM access is attempted to a bus number that is in the range defined by the secondary bus number and subordinate bus number range (not including secondary bus number), then type 1 configuration transactions are generated. The primary, secondary and subordinate bus numbers are written and updated by Root Port software to the type 1 PCI Configuration Header of the AXI Bridge for PCI Express core in the enumeration procedure.

When an ECAM access is attempted to a bus number that is out of the range defined by the secondary bus_number and subordinate bus number, the bridge does not generate a configuration request and signal a SLVERR response on the AXI4-Lite bus.

When a Unsupported Request (UR) response is received for a configuration read request, all ones are returned on the AXI4-Lite bus to signify that a device does not exist at the requested device address. It is the responsibility of the software to ensure configuration write requests are not performed to device addresses that do not exist. However, the AXI Bridge for PCI Express core asserts SLVERR response on the AXI4-Lite bus when a configuration write request is performed on device addresses that do not exist or a UR response is received.

If a configuration transaction is attempted to a device number other than zero, the AXI Bridge for PCI Express core asserts SLVERR on the AXI4-Lite bus. PCIe transactions are generated for only the device number of zero.

Unsupported Request to Upstream Traffic

To receive upstream traffic from a connected device, the Root Ports PCIe BAR_0 must be configured. If BAR_0 is not configured, the Root Port responds to requests with a Completion returned with Unsupported Request status.

Configuration Transaction Timeout

Configuration transactions are non-posted transactions. The AXI Bridge for PCI Express core has a timer for timeout termination of configuration transactions that have not completed on the PCIe link. SLVERR is returned when a configuration timeout occurs. Timeout of configuration transactions are flagged by an interrupt as well.

Abnormal Configuration Transaction Termination Responses

Responses on AXI4-Lite to abnormal terminations to configuration transactions are shown in Table 3-8.

Transfer Type Abnormal Condition		Bridge Response
Config Read or Write	Bus number not in the range of primary bus number through subordinate bus number	SLVERR response is asserted
Config Read or Write	Valid bus number and completion timeout occurs	SLVERR response is asserted
Config Read or Write	Device number not zero	SLVERR response is asserted
Config Read or Write	Completion timeout	SLVERR response is asserted
Config Write	Bus number in the range of secondary bus number through subordinate bus number and UR is returned.	SLVERR response is asserted

Table 3-8: Responses of AXI Bridge for PCI Express to Abnormal Configuration Terminations

Design Flow Steps

This chapter describes customizing and generating the core, constraining the core, and the simulation, synthesis and implementation steps that are specific to this IP core. More detailed information about the standard Vivado® design flows in the IP Integrator can be found in the following Vivado Design Suite user guides:

- Vivado Design Suite User Guide: Designing IP Subsystems using IP Integrator (UG994) [Ref 12]
- Vivado Design Suite User Guide: Designing with IP (UG896) [Ref 9]
- Vivado Design Suite User Guide: Getting Started (UG910) [Ref 8]
- Vivado Design Suite User Guide: Logic Simulation (UG900) [Ref 10]

Customizing and Generating the Core

This chapter includes information about using the Vivado® Design Suite to customize and generate the core.

If you are customizing and generating the core in the Vivado IP Integrator, see the *Vivado Design Suite User Guide: Designing IP Subsystems using IP Integrator* (UG994) [Ref 12] for detailed information. IP Integrator might auto-compute certain configuration values when validating or generating the design. To check whether the values do change, see the description of the parameter in this chapter. To view the parameter value you can run the validate_bd_design command in the Tcl Console.

Vivado Integrated Design Environment

You can customize the IP for use in your design by specifying values for the various parameters associated with the IP core using the following steps:

- 1. Select the IP from the IP catalog.
- 2. Double-click the selected IP, or select the **Customize IP** command from the toolbar or right-click menu.

For further details, see:

- "Working with IP" and "Customizing IP for the Design" in the Vivado Design Suite User Guide: Designing with IP (UG896) [Ref 9].
- "Working with the Vivado IDE" section in the Vivado Design Suite User Guide: Getting Started (UG910) [Ref 8].

Note: Figures in this chapter are illustrations of the Vivado IDE. This layout might vary from the current version.

Customizing the Core

The AXI Bridge for PCI Express core customization parameters are described in the following sections.

Basic Parameter Settings

The initial customization screen shown in Figure 4-1 is used to define the basic parameters for the core, including the component name, reference clock frequency, and silicon type.

	Re-customize IP	//////// ×

Figure 4-1: Basic Parameter Settings

Component Name

Base name of the output f iles generated for the core. The name must begin with a letter and can be composed of these characters: a to z, 0 to 9, and "_."

PCIe Device / Port Type

Indicates the PCI Express logical device type.

Reference Clock Frequency

Selects the frequency of the reference clock provided on sys_clk.

Slot Clock Configuration

Enables the Slot Clock Configuration bit in the Link Status register. Selecting this option means the link is synchronously clocked. See Clocking, page 42 for more information on clocking options.

Silicon Type

Selects the silicon type.

PCIe Link Configuration

The PCIe Link Config page is shown in Figure 4-2.

Figure 4-2: PCIe Link Configuration

Number of Lanes

The AXI Bridge for PCI Express[®] core requires the selection of the initial lane width. Table 4-1 defines the available widths and associated generated core. Wider lane width cores can train down to smaller lane widths if attached to a smaller lane-width device.

Table 4-1: Lane Width and Product Generated

Lane Width	Product Generated
x1	1-Lane
x2	2-Lane
x4	4-Lane
x8	8-Lane

Link Speed

The AXI Bridge for PCI Express core allows the selection of Maximum Link Speed supported by the device. Table 4-2 defines the lane widths and link speeds supported by the device. Higher link speed cores are capable of training to a lower link speed if connected to a lower link speed capable device.

Lane Width	Link Speed
×1	2.5 Gb/s, 5 Gb/s
x2	2.5 Gb/s, 5 Gb/s
x4	2.5 Gb/s, 5 Gb/s
x8	2.5 Gb/s, 5 Gb/s

Table 4-2: Lane Width and Link Speed

PCIe Block Location

The AXI Bridge for PCI Express core allows the selection of the PCI Express Hard Block within Xilinx FPGAs.

PCIe ID Settings

The Identity Settings pages are shown in Figure 4-3. These settings customize the IP initial values and device class code.

Figure 4-3: PCIe ID Settings

ID Initial Values

- **Vendor ID**: Identifies the manufacturer of the device or application. Valid identifiers are assigned by the PCI[™] Special Interest Group to guarantee that each identifier is unique. The default value, 10EEh, is the Vendor ID for Xilinx. Enter your vendor identification number here. FFFFh is reserved.
- **Device ID**: A unique identifier for the application; the default value, which depends on the configuration selected, is 70<*link speed*><*link width*>h. This field can be any value; change this value for the application.
- **Revision ID**: Indicates the revision of the device or application; an extension of the Device ID. The default value is 00h; enter values appropriate for the application.
- **Subsystem Vendor ID**: Further qualifies the manufacturer of the device or application. Enter a Subsystem Vendor ID here; the default value is 10EEh. Typically, this value is the same as Vendor ID. Setting the value to 0000h can cause compliance testing issues.
- **Subsystem ID**: Further qualifies the manufacturer of the device or application. This value is typically the same as the Device ID; the default value depends on the lane width and link speed selected. Setting the value to 0000h can cause compliance testing issues.

Class Code

The Class Code identifies the general function of a device, and is divided into three byte-size fields. The Vivado IDE allows you to either enter the 24-bit value manually (default) by either selecting the **Enter Class Code Manually** checkbox or using the Class Code lookup assistant to populate the field. De-select the "Enter Class Code Manually" checkbox to enable the Class Code assistant.

- **Base Class**: Broadly identifies the type of function performed by the device.
- **Sub-Class**: More specifically identifies the device function.
- **Interface**: Defines a specific register-level programming interface, if any, allowing device-independent software to interface with the device.

Class code encoding can be found in the PCI-SIG® specifications [Ref 5].

Class Code Look-up Assistant

The Class Code Look-up Assistant provides the Base Class, Sub-Class and Interface values for a selected general function of a device. This Look-up Assistant tool only displays the three values for a selected function. You must enter the values in Class Code for these values to be translated into device settings.

Base Address Registers

The Base Address Registers (BARs) screens shown in Figure 4-4 set the base address register space for the Endpoint configuration. Each BAR (0 through 5) configures the BAR Aperture Size and Control attributes of the Physical Function, as described in Table 4-3, page 73.

Figure 4-4: PCIe Base Address Register

Base Address Register Overview

The AXI Bridge for PCI Express core in Endpoint configuration supports up to three 32-bit BARs or three 64-bit BARs. The AXI Memory Mapped to PCI Express® in Root Port configuration supports one 32-bit BARs or one 64-bit BAR.

You should edit this parameter with the proper value for AXI-PCIe BAR Translation.

BARs can be one of two sizes. The selection applies to all BARs.

- **32-bit BARs**: The address space can be as small as 16 bytes or as large as 2 gigabytes. Used for Memory to I/O.
- **64-bit BARs**: The address space can be as small as 128 bytes or as large as 8 exabytes. Used for Memory only.

All BAR registers share these options:

- **Checkbox**: Click the checkbox to enable the BAR; deselect the checkbox to disable the BAR.
- **Type**: BARs can be Memory apertures only.
 - **Memory**: Memory BARs can be either 64-bit or 32-bit. Prefetch is enabled for 64-bit and not enabled for 32-bit. When a BAR is set as 64 bits, it uses the next BAR for the extended address space, making it inaccessible.
- **Size**: The available Size range depends on the PCIe® Device/Port Type and the Type of BAR selected. Table 4-3 lists the available BAR size ranges.

Table 4-3: BAR Size Ranges for Device Configuration

PCIe Device/Port Type	BAR Type	BAR Size Range
PCI Express Endpoint	32-bit Memory	128 Bytes - 2 Gigabytes
	64-bit Memory	128 Bytes - 8 Exabytes

• Value: The value assigned to the BAR based on the current selections.

For more information about managing the Base Address Register settings, see Managing Base Address Register Settings.

Managing Base Address Register Settings

Memory indicates that the address space is defined as memory aperture. The base address register only responds to commands that access the specified address space. Generally, memory spaces less than 4 KB in size should be avoided.

Disabling Unused Resources

For best results, disable unused base address registers to conserve system resources. A base address register is disabled by deselecting unused BARs in the Vivado IDE.

PCIe Misc

The PCIe miscellaneous screen is shown in Figure 4-5.

Figure 4-6: **AXI Base Address Registers**

Number of BARs

Indicates the number of AXI BARs enabled. The BARs are enabled sequentially.

64-bit Enable

Indicates if the AXI Base Address Register is 64-bit addressable. Selecting a 64-bit BAR consumes the subsequent BAR.

Aperture Base Address

Sets the base address for the address range associated to the BAR. You should edit this parameter to fit design requirements.

Aperture High Address

Sets the upper address threshold for the address range associated to the BAR. You should edit this parameter to fit design requirements.

AXI to PCIe Translation

Configures the translation mapping between AXI and PCI Express address space. You should edit this parameter to fit design requirements.

SRIOV BARs can be one of two sizes:

- **32-bit BARs**: The address space can be as small as 16 bytes or as large as 2 gigabytes. Used for Memory to I/O.
- **64-bit BARs**: The address space can be as small as 128 bytes or as large as 8 exabytes. Used for Memory only.

Figure 4-7: AXI System Settings

BASEADDR

Sets the AXI Base Address for the device. You should edit this parameter to fit design requirements.

HIGHADDR

Sets the AXI High Address threshold for the device. You should edit this parameter to fit design requirements.

S AXI ID WIDTH

Sets the ID width for the AXI Slave Interface.

Note: Multiple IDs are not supported for AXI Master Interface. Therefore, all signals concerned with ID are not available at AXI Master Interface.

S AXI ADDR WIDTH

AXI supports 32-bit addressing so this field is always set to 32.

S AXI DATA WIDTH

Sets the data bus width for the AXI Slave interface. This can be 64-bit or 128-bit based on your requirements. For X4G2 and X8G1, the core supports only 128-bit to achieve maximum performance.

M AXI ADDR WIDTH

AXI supports 32-bit addressing so this field is always set to 32.

M AXI DATA WIDTH

Sets the data bus width for the AXI Master interface. This can be 64-bit or 128-bit based on your requirement. For X4G2 and X8G1, the core supports only 128-bit to achieve maximum performance.

S AXI SUPPORTS NARROW BURST

Configures the IP to accept narrow burst transactions. When not enabled, the IP is optimized accordingly.

Shared Logic

Enables you to share common blocks across multiple instantiations by selecting one or more of the options on this page. For a details description of the shared logic feature, see Shared Logic in Chapter 3.

Output Generation

For details, see "Generating IP Output Products" in the *Vivado Design Suite User Guide: Designing with IP* (UG896) [Ref 9].

For information regarding the example design, see Example Design Output Structure in Chapter 5.

Constraining the Core

Required Constraints

The AXI Bridge for PCI Express® core requires a clock period constraint for the REFCLK input that agrees with the C_REF_CLK_FREQ parameter setting. In addition, pin-placement (LOC) constraints are needed that are board/part/package specific.

See Placement Constraints for more details on the constraint paths for FPGA architectures.

Additional information on clocking can be found in the Xilinx Solution Center for PCI Express (see Solution Centers, page 89).

System Integration

A typical embedded system including the AXI Bridge for PCI Express core is shown in Figure 2-2, page 10. Some additional components to this system in the Vivado IP integrator can include the need to connect the MicroBlaze[™] processor or Zynq® device ARM® processor peripheral to communicate with PCI Express[™] (in addition to the AXI4-Lite register port on the PCIe bridge). A helper core is available to achieve this functionality and bridges transactions from the AXI4-Lite MicroBlaze processor peripheral ports (DP and IP) to the AXI4 Interconnect (connected to the AXI Bridge for PCI Express). The axi2axi_connector IP core [Ref 6] provides this support.

The AXI Bridge for PCI Express core can be configured with each port connection for an AXI Vivado IP integrator system topology. When instantiating the core, ensure the following bus interface tags are defined.

BUS_INTERFACE M_AXI BUS_INTERFACE S_AXI BUS_INTERFACE S_AXI_CTL

PCIe Clock Integration

The PCIe differential clock input in the system might need to use a differential input buffer (that is instantiated separately) from the AXI Bridge for the PCIe core. The Vivado® IP integrator automatically inserts the appropriate clock buffer.

www.xilinx.com

Placement Constraints

The AXI Bridge for PCI Express core provides a Xilinx design constraint (XDC) file for all supported PCIe, Part, and Package permutations. You can find the generated XDC file in the Sources tab of the Vivado Integrated Design Environment after generating the IP in the Customize IP dialog box.

For design platforms, it might be necessary to manually place and constrain the underlying blocks of the AXI Bridge for the PCIe core. The modules to assign a LOC constraint include:

- the embedded Integrated Block for PCIe itself
- the GTX transceivers (for each channel)
- the PCIe differential clock input (if utilized)

The following subsection describes example constraints for the 7 series architecture.

Constraints for Virtex-7 and Kintex-7 FPGAs

This section highlights the LOC constraints to be specified in the XDC file for the AXI Bridge for PCI Express core for 7 series FPGA design implementations.

For placement/path information on the Integrated Block for PCIe itself, the following constraint can be utilized:

```
set_property LOC PCIE_X*Y* [get_cells {U0/comp_axi_enhanced_pcie/
comp_enhanced_core_top_wrap/axi_pcie_enhanced_core_top_i/pcie_7x_v2_0_inst/
pcie_top_i/pcie_7x_i/pcie_block_i}]
```

For placement/path information of the GTX transceivers, the following constraint can be utilized:

```
set_property LOC GTXE2_CHANNEL_X*Y* [get_cells {U0/comp_axi_enhanced_pcie/
comp_enhanced_core_top_wrap/axi_pcie_enhanced_core_top_i/pcie_7x_v2_0_inst/
gt_ges.gt_top_i/pipe_wrapper_i/pipe_lane[0].gt_wrapper_i/
gtx_channel.gtxe2_channel_i}]
```

For placement/path constraints of the input PCIe differential clock source (using the example provided in System Integration), the following can be utilized:

```
set_property LOC IBUFDS_GTE2_X*Y* [get_cells {*/PCIe_Diff_Clk_I/
USE_IBUFDS_GTE2.GEN_IBUFDS_GTE2[0].IBUFDS_GTE2_I}]
```

Constraints for Artix-7 FPGAs

Special consideration must be given to Artix®-7 device implementations. The same IP block constraint can be used as described previously (see Constraints for Virtex-7 and Kintex-7 FPGAs, page 79). However, the PCIe serial transceiver wrapper instance is different in the IP. Use the following LOC constraint for the GTP transceivers in Artix-7 devices.

```
set_property LOC GTPE2_CHANNEL_X*Y* [get_cells {U0/comp_axi_enhanced_pcie/
comp_enhanced_core_top_wrap/axi_pcie_enhanced_core_top_i/pcie_7x_v2_0_inst/
gt_ges.gt_top_i/pipe_wrapper_i/pipe_lane[0].gt_wrapper_i/
gtp_channel.gtpe2_channel_i}]
```

Also for Artix-7 devices, the GTP_COMMON must be constrained to a location. The following LOC constraint can be utilized.

```
set_property LOC GTPE2_COMMON_X*Y* [get_cells {U0/comp_axi_enhanced_pcie/
comp_enhanced_core_top_wrap/axi_pcie_enhanced_core_top_i/pcie_7x_v2_0_inst/
gt_ges.gt_top_i/pipe_wrapper_i/pipe_lane[0].pipe_quad.pipe_common.qpll_wrapper_i/
gtp_common.gtpe2_common_i}]
```

Clock Frequencies

The AXI Memory Mapped to PCI Express Bridge supports reference clock frequencies of 100 MHz and 250 MHz and is configurable within the Vivado IDE.

Simulation

This section contains information about simulating IP in the Vivado® Design Suite.

- For comprehensive information about Vivado simulation components, as well as information about using supported third party tools, see the *Vivado Design Suite User Guide: Logic Simulation* (UG900) [Ref 10].
- For information regarding simulating the example design, see Simulation Design Overview in Chapter 5.

Synthesis and Implementation

This section contains information about synthesis and implementation in the Vivado® Design Suite.

- For details about synthesis and implementation, see "Synthesizing IP" and "Implementing IP" in the Vivado Design Suite User Guide: Designing with IP (UG896) [Ref 9].
- For information regarding implementing the example design, see Implementation Design Overview in Chapter 5.

Example Design

This chapter contains information about the example design provided in the Vivado® Design Suite.

Overview

The example simulation design for the Endpoint configuration of the AXI-PCIe block consists of two discrete parts:

- The Root Port Model, a test bench that generates, consumes, and checks PCI Express bus traffic.
- An AXI BRAM Controller.

Simulation Design Overview

For the simulation design, transactions are sent from the Root Port Model to the AXI Bridge for PCI Express core configured as an Endpoint and processed inside the AXI BRAM controller design.

Figure 5-1 illustrates the simulation design provided with the AXI Bridge for PCI Express core.

Figure 5-1: Example Design Block Diagram

Note: The example design supports Verilog as the target language.

Customizing and Generating the Example Design

In Customize IP dialog box, make the following selections for the example design.

- 1. In the PCIE:Basics page, the example design supports only an Endpoint (EP) device, and no shared logic.
- 2. The PCIE:ID defaults are supported.
- 3. The PCIE:BARS defaults are supported.
- 4. The PCIE: Misc page defaults are supported.
- 5. In the AXI:BARS page, default values are assigned to the Base Address, High Address, and AXI to PCIe Translation values.
- 6. The AXI:System page default values are supported:

Note: After customizing the core, right-click the component name, and select **Open IP Example Design**. This opens a separate example design. Simulate the core by following the steps in the next section.

Simulating the Example Design

The example design can be run in any configuration using:

- Vivado Simulator
- Cadence IES Simulator
- Mentor Graphics Questa® SIM
- VCS Simulator

Vivado Simulator

By defaults, the simulator is set to Vivado simulator. To run a simulation, click **Run Behavioral Simulation** in the Flow Navigator.

Cadence IES

For a Cadence IES simulation, the following steps are required:

1. Run the following command in Vivado Tcl console of the example project to create an IES environment:

export_simulation -lib_map_path /proj/xbuilds/2013.3_daily_latest/clibs/ius/ 12.20.016/lin64/lib/ -simulator ies -directory ncsim

2. Go to ncsim directory on the terminal, and run the ./board_sim_ies.sh command.

Mentor Graphics Questa SIM

For a Questa SIM simulation, the following steps are required:

- 1. In the Vivado IDE, change the simulation settings as follows:
 - Target simulator: QuestaSim/ModelSim
- 2. On the Simulator tab, select Run Simulation -> Run behavioral simulation.

VCS Simulator

For a VCS simulation, the following steps are required:

- In the Vivado Tcl console, enter set_param ips.useProjectLanguageSubcoreFileDiscovery "true"
- In the Vivado Sources Tab, select AXI_BEAM_CTRL IP > Reset Output Products > Generate Output Products.
- 3. Run the following command in Vivado Tcl console of the example project to create a VCS environment:

export_simulation -lib_map_path /proj/xbuilds/2014.1_daily_latest/clibs/vcs/ H-2013.06-3/lin64/lib/ -simulator vcs_mx -force -directory vcs_mx

4. Go to the vcs_mx directory on the terminal, and run the ./board_sim_vcs_mx.sh command.

IMPORTANT: Simulation is not supported for configurations with the Silicon Revision option set to Initial_ES. Only implementation is supported. If simulation is performed, a DRP monitor error results.

Implementation Design Overview

For implementation design, the AXI-BRAM controller can be used as a scratch pad memory to write and read to Block RAM locations.

Example Design Elements

The core wrapper includes:

- An example Verilog HDL or VHDL wrapper (instantiates the cores and example design).
- A customizable demonstration test bench to simulate the example design.

Example Design Output Structure

Figure 5-2 provides the output structure of the example design.

Figure 5-2: Example Design Output Structure

Table 5-1 provides a descriptions of the contents of the example design directories.

Directory	Description
project_1/axi_pcie_0_example	Contains all example design files.
project_1/axi_pcie_0_example/ axi_pcie_0_example.srcs/sources_1/imports/ example_design/	Contains the top module for the example design, xilinx_axi_pcie_ep.v.
project_1/axi_pcie_0_example/ axi_pcie_0_example.srcs/sources_1/ip/axi_pcie_0	Contains the XDC file based on device selected, all design files and subcores used in axi_pcie, and the top modules for simulation and synthesis.
project_1/axi_pcie_0_example/ axi_pcie_0_example.srcs/sources_1/ip/ axi_bram_ctrl_0	Contains block RAM controller files used in example design.
project_1/axi_pcie_0_example/ axi_pcie_0_example.srcs/sim_1/imports/ simulation/dsport	Contains all RP files, cgator and PIO files.

Table 5-1: Example Design Structure

Directory	Description
project_1/axi_pcie_0_example/ axi_pcie_0_example.srcs/sim_1/imports/ simulation/functional	Contains the testbench file.

Chapter 6

Test Bench

For information about the test bench for the example design, see Chapter 5, Example Design.

Appendix A

Migrating and Upgrading

This appendix contains information about migrating a design from ISE[®] Design Suite to the Vivado[®] Design Suite, and for upgrading to a more recent version of the IP core. For customers upgrading in the Vivado Design Suite, important details (where applicable) about any port changes and other impact to user logic are included.

Migrating to the Vivado Design Suite

For information on migrating to the Vivado Design Suite, see *Vivado Design Suite Migration Methodology Guide (UG911)* [Ref 7].

Upgrading in the Vivado Design Suite

This section provides information about any changes to the user logic or port designations that take place when you upgrade to a more current version of this core in the Vivado Design Suite.

Parameter Changes

No parameter changes.

Port Changes

No port changes.

Appendix B

Debugging

This appendix provides information for using the resources available on the Xilinx Support website, debug tools, and other step-by-step processes for debugging designs that use the AXI Bridge for PCI Express core.

Finding Help on Xilinx.com

To help in the design and debug process when using the AXI Bridge for PCI Express core, the <u>Xilinx Support web page</u> (www.xilinx.com/support) contains key resources such as product documentation, release notes, answer records, information about known issues, and links for opening a Technical Support WebCase.

Documentation

This product puide is the main document associated with the AXI Bridge for PCI Express core. This guide, along with documentation related to all products that aid in the design process, can be found on the Xilinx Support web page (<u>www.xilinx.com/support</u>) or by using the Xilinx Documentation Navigator.

You can download the Xilinx Documentation Navigator from the Design Tools tab on the Downloads page (<u>www.xilinx.com/download</u>). For more information about this tool and the features available, see the online help after installation.

Solution Centers

See the <u>Xilinx Solution Centers</u> for support on devices, software tools, and intellectual property at all stages of the design cycle. Topics include design assistance, advisories, and troubleshooting tips.

The PCI Express Solution Center is located at <u>Xilinx Solution Center for PCI Express</u>. Extensive debugging collateral is available in AR: <u>56802</u>.

Answer Records

Answer Records include information about commonly encountered problems, helpful information on how to resolve these problems, and any known issues with a Xilinx product.

www.xilinx.com

Answer Records are created and maintained daily ensuring that users have access to the most accurate information available.

Answer Records for this core are listed below, and can be located by using the Search Support box on the main <u>Xilinx support web page</u>. To maximize your search results, use proper keywords, such as:

- the product name
- tool messages
- summary of the issue encountered

A filter search is available after results are returned to further target the results.

Master Answer Record for the AXI Bridge for PCI Express

AR: <u>54646</u>

Contacting Technical Support

Xilinx provides technical support at <u>www.xilinx.com/support</u> for this LogiCORE[™] IP product when used as described in the product documentation. Xilinx cannot guarantee timing, functionality, or support of product if implemented in devices that are not defined in the documentation, if customized beyond that allowed in the product documentation, or if changes are made to any section of the design labeled DO NOT MODIFY.

To contact Xilinx Technical Support:

- 1. Navigate to <u>www.xilinx.com/support</u>.
- 2. Open a WebCase by selecting the <u>WebCase</u> link located under Support Quick Links.

When opening a WebCase, include:

- Target FPGA including package and speed grade.
- All applicable Xilinx Design Tools and simulator software versions.
- Additional files based on the specific issue might also be required. See the relevant sections in this debug guide for guidelines about which files to include with the WebCase.

Note: Access to WebCase is not available in all cases. Log in to the WebCase tool to see your specific support options.

Debug Tools

There are many tools available to address AXI Bridge for PCI Express design issues. It is important to know which tools are useful for debugging various situations.

Vivado Lab Tool

Vivado® lab tools inserts logic analyzer (ILA) and virtual I/O (VIO) cores directly into your design. Vivado lab tools also allow you to set trigger conditions to capture application and integrated block port signals in hardware. Captured signals can then be analyzed. This feature in the Vivado IDE is used for logic debugging and validation of a design running in Xilinx devices.

The Vivado logic analyzer is used to interact with the logic debug LogiCORE IP cores, including:

- ILA 2.0 (and later versions)
- VIO 2.0 (and later versions)

See Vivado Design Suite User Guide: Programming and Debugging (UG908) [Ref 11].

Reference Boards

Various Xilinx development boards support thethe AXI Bridge for PCI Express core. These boards can be used to prototype designs and establish that the core can communicate with the system.

- 7 series evaluation boards
 - KC705
 - VC707
 - ZC706

Third-Party Tools

This section describes third-party software tools that can be useful in debugging.

LSPCI (Linux)

LSPCI is available on Linux platforms and allows users to view the PCI Express device configuration space. LSPCI is usually found in the /sbin directory. LSPCI displays a list of devices on the PCI buses in the system. See the LSPCI manual for all command options. Some useful commands for debugging include:

• lspci -x -d [<vendor>]:[<device>]

This displays the first 64 bytes of configuration space in hexadecimal form for the device with vendor and device ID specified (omit the -d option to display information for all devices). The default Vendor/Device ID for Xilinx cores is 10EE:6012. Here is a sample of a read of the configuration space of a Xilinx device:

Included in this section of the configuration space are the Device ID, Vendor ID, Class Code, Status and Command, and Base Address Registers.

lspci -xxxx -d [<vendor>]:[<device>]

This displays the extended configuration space of the device. It can be useful to read the extended configuration space on the root and look for the Advanced Error Reporting (AER) registers. These registers provide more information on why the device has flagged an error (for example, it might show that a correctable error was issued because of a replay timer timeout).

• lspci -k

Shows kernel drivers handling each device and kernel modules capable of handling it (works with kernel 2.6 or later).

PCItree (Windows)

PCItree can be downloaded at <u>www.pcitree.de</u> and allows the user to view the PCI Express device configuration space and perform one DWORD memory writes and reads to the aperture.

The configuration space is displayed by default in the lower right corner when the device is selected, as shown in Figure B-1.

PCI-SIG Software Suites

PCI-SIG® software suites such as PCIE-CV can be used to test compliance with the specification. This software can be downloaded at <u>www.pcisig.com</u>.

Simulation Debug

The simulation debug flow for Mentor Graphics Questa® SIM is illustrated in Figure B-3. A similar approach can be used with other simulators.

Hardware Debug

Hardware issues can range from device recognition issues to problems seen after hours of testing. This section provides debug flow diagrams for some of the most common issues. Endpoints that are shaded gray indicate that more information is found in sections after Figure B-4.

Figure B-4: Design Fails in Hardware Debug Flow Diagram

FPGA Configuration Time Debug

Device initialization and configuration issues can be caused by not having the FPGA configured fast enough to enter link training and be recognized by the system. Section 6.6 of *PCI Express Base Specification, rev. 2.1* [Ref 5] states two rules that might be impacted by FPGA Configuration Time:

- A component must enter the LTSSM Detect state within 20 ms of the end of the Fundamental reset.
- A system must guarantee that all components intended to be software visible at boot time are ready to receive Configuration Requests within 100 ms of the end of Conventional Reset at the Root Complex.

These statements basically mean the FPGA must be configured within a certain finite time, and not meeting these requirements could cause problems with link training and device recognition.

Configuration can be accomplished using an onboard PROM or dynamically using JTAG. When using JTAG to configure the device, configuration typically occurs after the Chipset has enumerated each peripheral. After configuring the FPGA, a soft reset is required to restart enumeration and configuration of the device. A soft reset on a Windows-based PC is performed by going to **Start** > **Shut Down** and then selecting **Restart**.

To eliminate FPGA configuration as a root cause, you should perform a soft restart of the system. Performing a soft reset on the system keeps power applied and forces re-enumeration of the device. If the device links up and is recognized after a soft reset is performed, the FPGA configuration is most likely the issue. Most typical systems use ATX power supplies which provide some margin on this 100 ms window as the power supply is normally valid before the 100 ms window starts.

Link is Training Debug

Figure B-5 shows the flowchart for link trained debug.

Figure B-5: Link Trained Debug Flow Diagram

FPGA Configuration Time Debug

Device initialization and configuration issues can be caused by not having the FPGA configured fast enough to enter link training and be recognized by the system. Section 6.6

www.xilinx.com

of *PCI Express Base Specification, rev. 2.1* [Ref 5] states two rules that might be impacted by FPGA Configuration Time:

- A component must enter the LTSSM Detect state within 20 ms of the end of the Fundamental reset.
- A system must guarantee that all components intended to be software visible at boot time are ready to receive Configuration Requests within 100 ms of the end of Conventional Reset at the Root Complex.

These statements basically mean the FPGA must be configured within a certain finite time, and not meeting these requirements could cause problems with link training and device recognition.

Configuration can be accomplished using an onboard PROM or dynamically using JTAG. When using JTAG to configure the device, configuration typically occurs after the Chipset has enumerated each peripheral. After configuring the FPGA, a soft reset is required to restart enumeration and configuration of the device. A soft reset on a Windows based PC is performed by going to **Start** > **Shut Down** and then selecting **Restart**.

To eliminate FPGA configuration as a root cause, you should perform a soft restart of the system. Performing a soft reset on the system keeps power applied and forces re-enumeration of the device. If the device links up and is recognized after a soft reset is performed, then FPGA configuration is most likely the issue. Most typical systems use ATX power supplies which provides some margin on this 100 ms window as the power supply is normally valid before the 100 ms window starts.

Clock Debug

One reason to not deassert the user_reset_out signal is that the FPGA PLL (MMCM) and Transceiver PLL have not locked to the incoming clock. To verify lock, monitor the transceiver RXPLLLKDET output and the MMCM LOCK output. If the PLLs do not lock as expected, it is necessary to ensure the incoming reference clock meets the requirements in 7 Series FPGAs GTX/GTH Transceivers User Guide [Ref 3]. The REFCLK signal should be routed to the dedicated reference clock input pins on the serial transceiver, and the design should instantiate the IBUFDS_GTE2 primitive in the design. See the 7 Series FPGAs GTX/GTH Transceivers User Guide for more information on PCB layout requirements, including reference clock requirements.

Reference clock jitter can potentially close both the TX and RX eyes, depending on the frequency content of the phase jitter. Therefore, maintain as clean a reference clock as possible. Reduce crosstalk on REFCLK by isolating the clock signal from nearby high-speed traces. Maintain a separation of at least 25 mils from the nearest aggressor signals. The PCI Special Interest Group website provides other tools for ensuring the reference clocks are compliant to the requirements of the *PCI Express Specification*: <u>www.pcisig.com/specifications/pciexpress/compliance/compliance_library</u>.

Debugging PCI Configuration Space Parameters

Often, a user application fails to be recognized by the system, but the Xilinx PIO Example design works. In these cases, the user application is often using a PCI configuration space setting that is interfering with the system systems ability to recognize and allocate resources to the card.

Xilinx solutions for PCI Express handle all configuration transactions internally and generate the correct responses to incoming configuration requests. Chipsets have limits to the amount of system resources they can allocate and the core must be configured to adhere to these limitations.

The resources requested by the Endpoint are identified by the BAR settings within the Endpoint configuration space. You should verify that the resources requested in each BAR can be allocated by the chipset. I/O BARs are especially limited so configuring a large I/O BAR typically prevents the chipset from configuring the device. Generate a core that implements a small amount of memory (approximately 2 KB) to identify if this is the root cause.

The Class Code setting selected in the Vivado IDE can also affect configuration. The Class Code informs the Chipset as to what type of device the Endpoint is. Chipsets might expect a certain type of device to be plugged into the PCI Express slot and configuration might fail if it reads an unexpected Class Code. The BIOS could be configurable to work around this issue.

Using a link analyzer, it is possible to monitor the link traffic and possibly determine when during the enumeration and configuration process problems occur.

Using a Link Analyzer to Debug Device Recognition Issues

In cases where the link is up (user_lnk_up = 1), but the device is not recognized by the system, a link analyzer can help solve the issue. It is likely the FPGA is not responding properly to some type of access. The link view can be used to analyze the traffic and see if anything looks out of place.

To focus on the issue, it might be necessary to try different triggers. Here are some trigger examples:

- Trigger on the first INIT_FC1 and/or UPDATE_FC in either direction. This allows the analyzer to begin capture after link up.
- The first TLP normally transmitted to an Endpoint is the Set Slot Power Limit Message. This usually occurs before Configuration traffic begins. This might be a good trigger point.
- Trigger on Configuration TLPs.
- Trigger on Memory Read or Memory Write TLPs.

Data Transfer Failing Debug

Figure B-6 shows the flowchart for data transfer debug.

Figure B-6: Data Transfer Debug Flow Diagram

Identifying Errors

See Abnormal Conditions in Chapter 3 for information about how the Slave side and Master side of the AXI Bridge for PCI Express handle abnormal conditions.

Next Steps

If the debug suggestions listed previously do not resolve the issue, open a support case or visit the Xilinx User Community forums to have the appropriate Xilinx expert assist with the issue.

To create a technical support case in WebCase, see the Xilinx website at:

www.xilinx.com/support/clearexpress/websupport.htm

Items to include when opening a case:

- Detailed description of the issue and results of the steps listed above.
- Vivado lab tools captures taken in the steps above.

To discuss possible solutions, use the Xilinx User Community:

forums.xilinx.com/xlnx/

Transceiver Debug

Table B-1 describes the ports used to debug transceiver related issues.

RECOMMENDED: Debugging transceiver issues is recommended for advanced users only.

Table B-1: Ports Used for Transceiver Debug

Port	Direction (I/O)		Description
pipe_txprbssel	Ι	3	PRBS input.
pipe_rxprbssel	Ι	3	PRBS input.
pipe_rxprbsforceerr	Ι	1	PRBS input.
pipe_rxprbscntrreset	Ι	1	PRBS input.
pipe_loopback	Ι	1	PIPE loopback.
pipe_rxprbserr	0	1	PRBS output.
pipe_rst_fsm	0		Should be examined if pipe_rst_idle is stuck at 0.
pipe_qrst_fsm	0		Should be examined if pipe_rst_idle is stuck at 0.

Table B-1: Ports Used for Transceiver Debug (Cont'd)

Port	Direction (I/O)	Description
pipe_sync_fsm_tx	0	Should be examined if pipe_rst_fsm stuck at 11'b1000000000, or pipe_rate_fsm stuck at 24'b0001000000000000000000000000000000000
pipe_sync_fsm_rx	0	Deprecated.
pipe_drp_fsm	0	Should be examined if pipe_rate_fsm is stuck at 100000000.
pipe_rst_idle	0	Wrapper is in IDLE state if pipe_rst_idle is High.
pipe_qrst_idle	0	Wrapper is in IDLE state if pipe_qrst_idle is High.
pipe_rate_idle	0	Wrapper is in IDLE state if pipe_rate_idle is High.
PIPE_DEBUG_0/gt_txresetdone	Ο	Generic debug ports to assist debug. These are generic debug ports to bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUGT_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_1/gt_rxresetdone	0	Generic debug ports to assist debug. These are generic debug ports to bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUGT_9 are intended for per lane signals.The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_2/gt_phystatus	0	Generic debug ports to assist debug. These are generic debug ports to bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_3/gt_rxvalid	0	Generic debug ports to assist debug. These are generic debug ports to bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_4/ gt_txphaligndone	0	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_5/ gt_rxphaligndone	0	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.

Table B-1:	Ports Used for Transceiver Debug (Cont'd)
------------	---

Port	Direction (I/O)	Description
PIPE_DEBUG_6/ gt_rxcommadet	0	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_7/gt_rdy	ο	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_8/ user_rx_converge	0	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.
PIPE_DEBUG_9/ PIPE_TXELECIDLE	0	Generic debug ports to assist debug. These generic debug ports bring out internal PIPE Wrapper signals, such as raw GT signals. DEBUG_0 to DEBUG_9 are intended for per lane signals. The bus width of these generic debug ports depends on the number of lanes configured in the wrapper.

Interface Debug

AXI4-Lite Interfaces

Read from a register that does not have all 0s as a default to verify that the interface is functional. Output s_axi_arready asserts when the read address is valid and output s_axi_rvalid asserts when the read data/response is valid. If the interface is unresponsive ensure that the following conditions are met.

- The axi_ctl_aclk and axi_ctl_aclk_out clock inputs are connected and toggling.
- The interface is not being held in reset, and axi_aresetn is an active-Low reset.
- Ensure that the main core clocks are toggling and that the enables are also asserted.
- Has a simulation been run? Verify in simulation and/or a Vivado lab tools capture that the waveform is correct for accessing the AXI4-Lite interface.

Revision History

The following table shows the revision history for this document.

Date	Version	Revision
04/02/2014	2.3	Updated simulation information.Minor changes and updates.
12/18/2013	2.3	 Updated for core v2.3. Updated Example Design chapter. Updated parameter changes and port changes in Migrating and Updating chapter.
10/02/2013	2.2	 Updated for core v2.2. Updated resource utilization numbers. Added information about the Shared Logic feature. Added example design information. Added port and parameter upgrade information. Added transceiver debug information.
03/20/2013	2.0	Updated for core v2.0, and for Vivado Design Suite-only support.
12/18/2012	1.2	 Updated core v1.06a, ISE Design Suite 14.4, and Vivado Design Suite 2012.4. Updated Chapter 4, Customizing and Generating the Core. Updated Chapter 5, Constraining the Core. Added Appendix B, Debugging.
10/16/2012	1.1	 Updated core v1.05a, ISE Design Suite 14.3, and Vivado Design Suite 2012.3. Added Chapter 4, Customizing and Generating the Core. Major updates to PCIe Clock Integration. Added Unsupported Request to Upstream Traffic and Clock Frequencies.
07/25/2012	1.0	Initial Xilinx release. This release is for core version 1.04.a with ISE Design Suite 14.2 and Vivado Design Suite 2012.2. This document replaces DS820, LogiCORE IP AXI Bridge for PCI Express Data Sheet.
