# Introduction

The Xilinx® LogiCORE™ IP JESD204 PHY core implements a JESD204B physical interface to simplify sharing serial transceiver channels between transmit and receive cores. This core is not intended to be used standalone and should only be used only in conjunction with the JESD204 core.

*Note:* This core is provided as standalone IP for use in the JESD204 IP example design only.

# Features

- Designed to JEDEC® JESD204B [Ref 1]
- Supports 1 to 12 lane configurations
- Supports Subclass 0, 1, and 2
- Physical Layer functions provided
- Supports transceiver sharing between TX and RX cores

2. For the supported versions of the tools, see the Xilinx Design Tools: Release Notes Guide.

# Overview

The LogiCORE™ IP JESD204 PHY core implements a JESD204B Physical interface supporting line rates between 1.0 and 12.5 Gb/s on 1 to 12 lanes using GTX, GTH, GTY or GTP transceivers. See the device data sheets listed in References for maximum line rates supported by each device and family. The JESD204 PHY core can be configured with independent transmit and receive line rates.

Figure 1-1 shows a block diagram of the JESD204 PHY core with no shared logic in the example design.

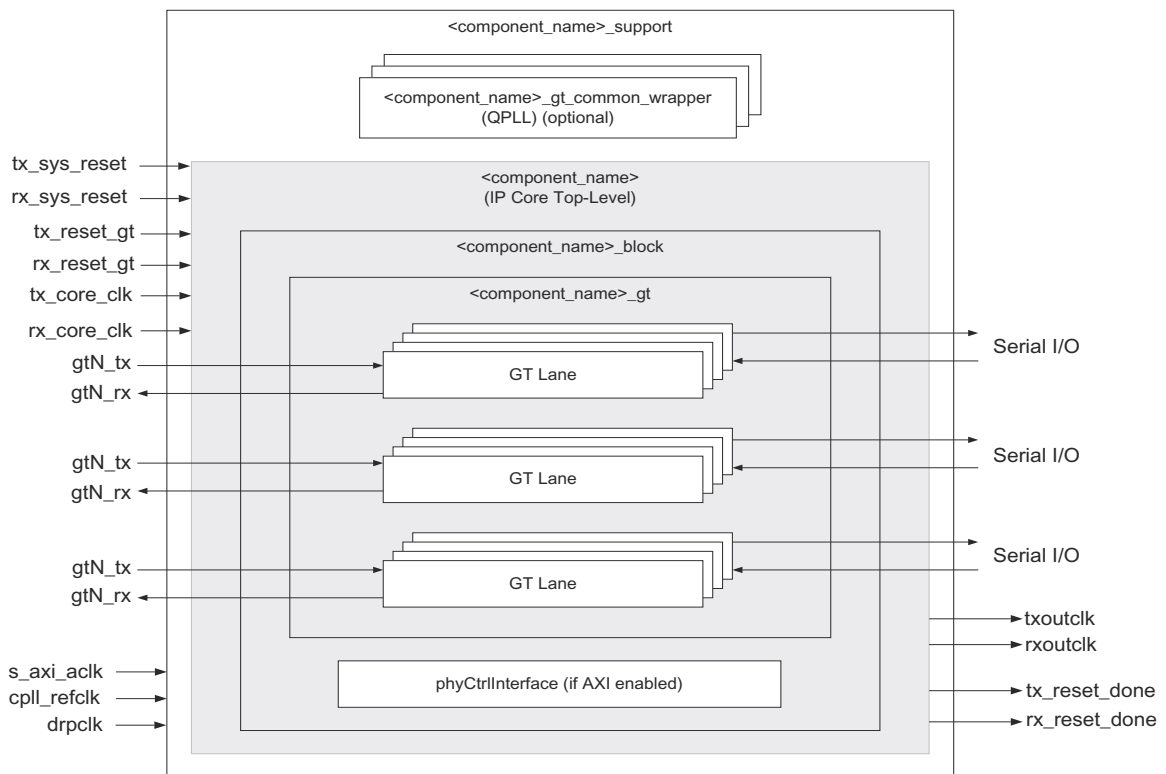

*Figure 1-1:*    **JESD204 PHY Block Diagram – No Shared Logic in Example Design**

www.xilinx.com

Send Feedback

Figure 1-2 shows a block diagram of the JESD204 PHY core with shared logic in the core.

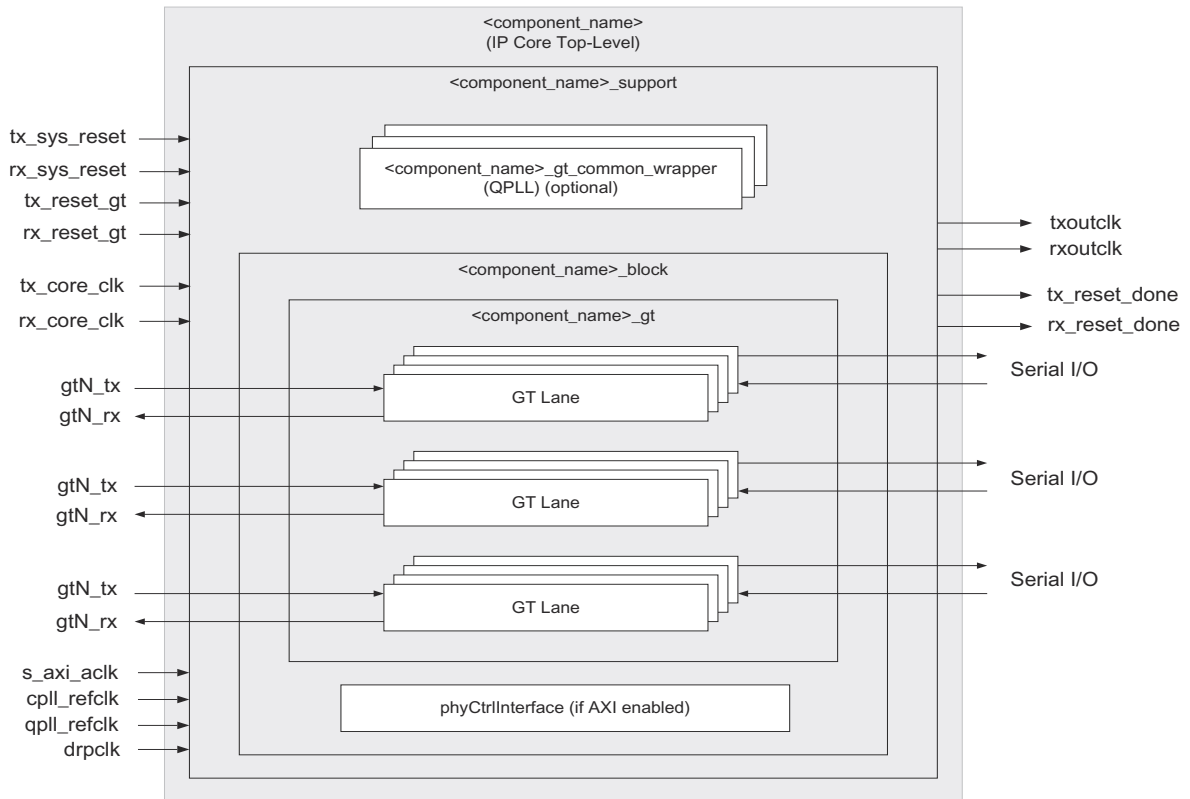

*Figure 1-2:* **JESD204 PHY Block Diagram – Shared Logic in Core**

When used in conjunction with the JESD204, the JESD204 PHY core is a fully-verified solution design delivered by using the Xilinx® Vivado® Design Suite. In addition, an example design is provided in Verilog. For more information, see the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2].

# Applications

The JESD204 PHY core is a sub-core of the JESD204 core. For application information, see the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2]. Figure 1-3 shows a JESD204 PHY used in the JESD204 design.

*Figure 1-3:* **JESD204 PHY Used in JESD204 Solution**

The JESD204 PHY allows complex transceiver and JESD204 core sharing to be accomplished. Figure 1-4, taken from Vivado IP integrator, shows three JESD204 PHY IPs sharing transceivers between four JESD204 IP cores.

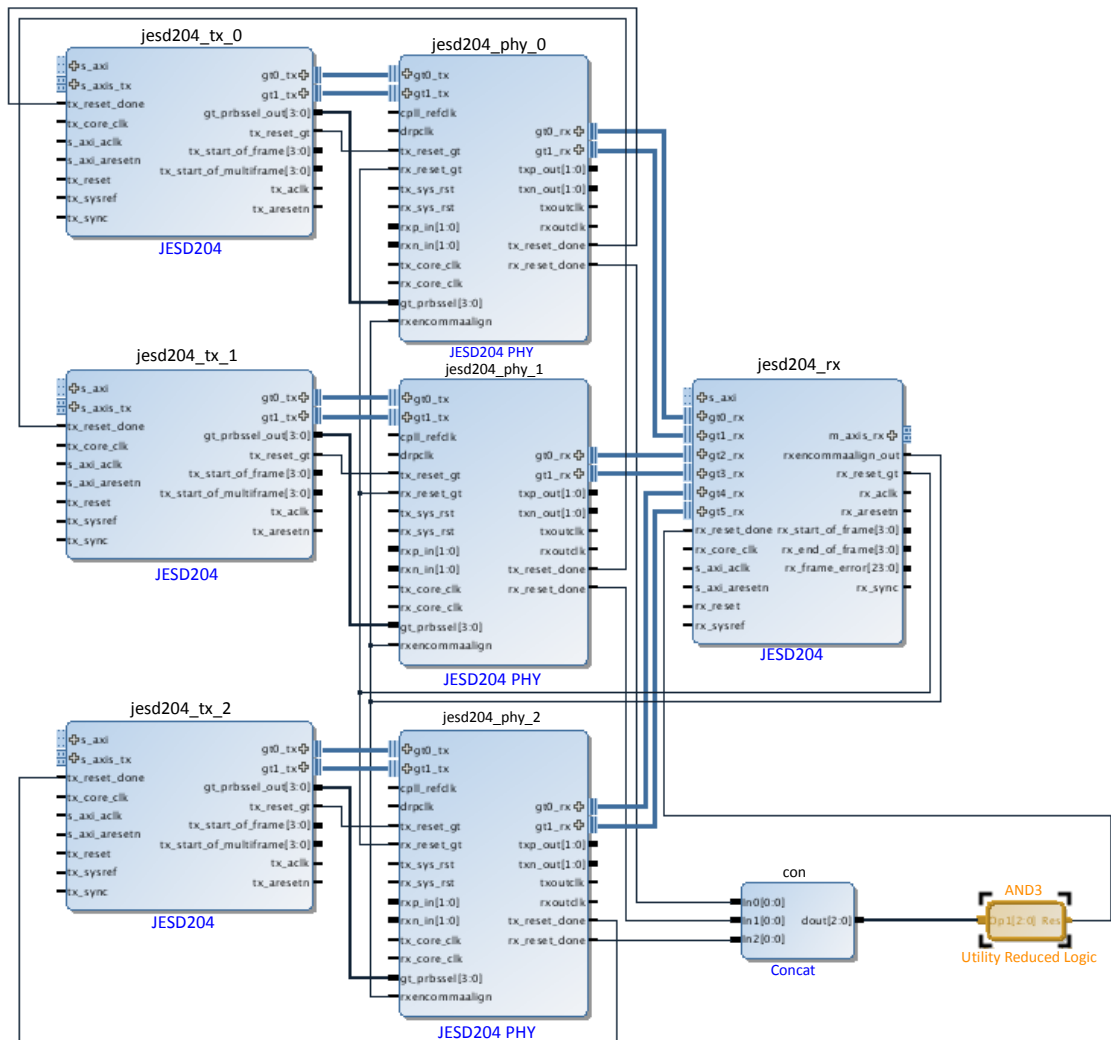

*Figure 1-4:* **IP Integrator Example Design**

The JESD204 PHY supports the simple one JESD204, one JESD204 PHY solution to the extremely complex multi-JED204 interleaved JESD204 PHY configurations. See the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2] and the JESD204 Evaluation Lounge for complex JESD204 and JESD204 PHY transceiver sharing examples.

## Licensing and Ordering Information

This Xilinx LogiCORE™ IP module is provided at no additional cost with the Xilinx Vivado Design Suite under the terms of the Xilinx End User License. Information about this and other Xilinx LogiCORE IP modules is available at the Xilinx Intellectual Property page. For information about pricing and availability of other Xilinx LogiCORE IP modules and tools, contact your local Xilinx sales representative.

# Product Specification

This chapter details the resource utilization and ports for the JESD204 PHY core.

## Performance

For details about performance, visit the Performance and Resource Utilization web page.

The core meets the performance specification of JESD204B. The maximum serial line rate is limited by the maximum GTX/GTP/GTH/GTY line rate for the chosen device. See the appropriate device data sheet listed in References in Appendix C.

## Resource Utilization

For details about resource utilization, visit the Performance and Resource Utilization web page.

## Port Descriptions

This section contains details about the JESD204 PHY ports.

### Clock and Reset Ports

The clock and reset ports available on the delivered core component depend on the Shared Logic selection when customizing the core. Table 2-1 lists the ports available regardless of core settings.

*Table 2-1:* **Common Clock and Reset Ports**

| Signal Name | Direction | Description |
|---|---|---|
| **Clocks** | | |
| tx_core_clock | In | JESD204 core logic clock used to drive txusrclk2 of transceiver. Frequency = serial line rate/40. |

*Table 2-1:* **Common Clock and Reset Ports** *(Cont'd)*

| Signal Name | Direction | Description |
|---|---|---|
| rx_core_clock | In | JESD204 core logic clock used to drive rxusrclk2 of transceiver. Frequency = serial line rate/40. |
| txoutclk | Out | Output clock from transceiver. Can be used as JESD204 TX core clock when in Subclass 0 mode. This clock is sourced from the first transceiver in the JESD PHY core. If this clock output is used then do not power down this transceiver. |
| rxoutclk | Out | Output clock from transceiver. Can be used as JESD204 RX core clock when in Subclass 0 mode. This clock is sourced from the first transceiver in the JESD PHY core. If this clock output is used then do not power down this transceiver |
| drp_clk | In | Dynamic Reconfiguration Port (DRP) clock. A free-running DRP clock is required for UltraScale devices and optional for 7 series devices. |
| cpll_refclk | In | Reference clock for the Transceiver Channel PLL. |
| qpll_refclk | In | Reference clock for the Quad Common PLL in 7 series. |
| qpll0/1_refclk | In | Reference clock for the Quad Common PLL(s) in UltraScale devices. |
| **Resets** | | |
| tx_reset_gt | In | Tx channel datapath asynchronous logic reset. |
| rx_reset_gt | In | Rx channel datapath asynchronous logic reset. |

Table 2-2 lists the ports that are available only when using Shared Logic in the example design.

*Table 2-2:* **Clocks and Resets for Shared Logic in Example Design**

| Signal Name[1] | Direction | Description |
|---|---|---|
| **Clocks** | | |
| txusrclk | In | Present only on GTP devices. Input Clock to transceiver. |
| rxusrclk | In | Present only on GTP devices. Input Clock to transceiver. |
| commonM_qpll_clk_in | In | Clock input for the QPLL (Quad M). Always present. |
| commonM_qpll_refclk_in | In | Reference clock input for the QPLL (Quad M). Always present. |
| commonM_pll0_clk_in | In | Reference clock input for the PLL (Quad M). Only present when PLL0 is selected. |
| commonM_pll0_refclk_in | In | Clock input for the PLL (Quad M). Only present when PLL0 is selected. |
| commonM_pll1_clk_in | In | Clock input for the PLL (Quad M). Only present when PLL0 is selected. |
| commonM_pll1_refclk_in | In | Reference clock input for the PLL (Quad M). Only present when PLL1 is selected. |
| commonM_qpll0_clk_in | In | Clock input for the QPLL (Quad M). Only present when QPLL0 is selected. |

*Table 2-2:*    **Clocks and Resets for Shared Logic in Example Design** *(Cont'd)*

| Signal Name[1] | Direction | Description |
|---|---|---|
| commonM_qpll0_refclk_in | In | Reference clock input for the QPLL (Quad M). Only present when QPLL0 is selected. |
| commonM_qpll1_clk_in | In | Clock input for the QPLL (Quad M). Only present when QPLL1 is selected. |
| commonM_qpll1_refclk_in | In | Reference clock input for the QPLL (Quad M). Only present when QPLL1 is selected. |
| **Resets** | | |
| qpll_reset_out | Out | Reset output from transceiver logic to reset Common Block. Present only when QPLL selected. |
| qpll0_reset_out | Out | Reset output from transceiver logic to reset QPLL0 Common Block when QPLL0 is selected or the AXI-4 Lite Management Interface is enabled and at least one channel is using either QPLL0 or QLL1. **Note:**  This port is only applicable to UltraScale devices. |
| qpll1_reset_out | Out | Reset output from transceiver logic to reset QPLL1 Common Block when QPLL1 is selected or the AXI-4 Lite Management Interface is enabled and at least one channel is using either QPLL0 or QLL1. **Note:**  This port is only applicable to UltraScale devices. |
| commonM_pll0_reset_out | Out | Reset output from transceiver logic used to reset Common Block. Only present when PLL0 selected. |
| commonM_pll1_reset_out | Out | Reset output from transceiver logic used to reset Common Block. Only present when PLL1 selected. |
| pll_reset_out | Out | Reset output from transceiver used to reset Common Block. Only present on UltraScale devices. |
| mmcm_reset | Out | Reset output from transceiver to reset MMCM. Only present for GTP devices. |
| mmcm_lock | In | Input from MMCM indicating that the clocks have locked. Only present for GTP devices. |
| tx_sys_reset | In | Tx PLL and datapath asynchronous logic reset. |
| rx_sys_reset | In | Rx PLL and datapath asynchronous logic reset. |

**Notes:**
1.  M = Number of QUADs – 1

Table 2-3 lists the ports that are available only when using Shared Logic in the core.

*Table 2-3:*    **Clocks for Shared Logic in Core**

| Signal Name[1] | Direction | Description |
|---|---|---|
| **Clocks** | | |
| commonM_qpll_clk_out | Out | Clock output from the QPLL (Quad M). Only present when QPLL enabled. |

*Table 2-3:* **Clocks for Shared Logic in Core** *(Cont'd)*

| Signal Name[1] | Direction | Description |
|---|---|---|
| commonM_qpll_refclk_out | Out | Reference clock output from the QPLL (Quad M). Only present when QPLL enabled. |
| commonM_qpll_lock_out | Out | Lock output from the QPLL (Quad M). Only present when QPLL is enabled. |
| commonM_pll0_clk_out | Out | Clock output from the PLL (Quad M). Only present when PLL0 is enabled. |
| commonM_pll0_refclk_out | Out | Reference clock input from the PLL (Quad M). Only present when PLL0 is enabled. |
| commonM_pll0_lock_out | Out | Lock output from the PLL0 (Quad M). Only present when PLL0 is enabled. |
| commonM_pll1_clk_out | Out | Clock output from the PLL (Quad M). Only present when PLL0 is enabled. |
| commonM_pll1_refclk_out | Out | Reference clock output from the PLL (Quad M). Only present when PLL1 is enabled. |
| commonM_pll1_lock_out | Out | Lock output from the PLL1 (Quad M). Only present when PLL1 is enabled. |
| commonM_qpll0_clk_out | Out | Clock output from the QPLL (Quad M). Only present when QPLL0 is enabled. |
| commonM_qpll0_refclk_out | Out | Reference clock output from the QPLL (Quad M). Only present when QPLL0 is enabled. |
| commonM_qpll0_lock_out | Out | Lock output from the QPLL0 (Quad M). Only present when QPLL0 is enabled. |
| commonM_qpll1_clk_out | Out | Clock output from the QPLL (Quad M). Only present when QPLL1 is enabled. |
| commonM_qpll1_refclk_out | Out | Reference clock output from the QPLL (Quad M). Only present when QPLL1 is enabled. |
| commonM_qpll1_lock_out | Out | Lock output from the QPLL1 (Quad M). Only present when QPLL1 enabled. |
| mmcm_locked | Out | Output indicating that the internal MMCM has locked. Signal can be shared with other IP using the same clocks. Only present for GTP devices. |

**Notes:**
1. M = Number of QUADs – 1

## Transceiver Interface Ports – TX

The transceiver ports available on the delivered core component depend on the Shared Logic selection when customizing the core; see Table 2-4 or Table 2-5.

*Table 2-4:* **Transceiver Interface Ports – Shared Logic in Example Design**

| Signal Name | Direction | Description |
|---|---|---|
| gt*N*_txdata[31:0] | In | TX data to transceiver. *N* = 0 ... [Lanes – 1] |
| gt*N*_txcharisk[3:0] | In | TX Char is K to transceiver. *N* = 0 ... [Lanes – 1] |
| gt_prbssel[2:0][1] | In | PRBS select to transceiver. |

**Notes:**
1. For UltraScale devices, the width of gt_prbssel is [3:0].

*Table 2-5:* **TX Core: Transceiver Interface Ports – Shared Logic in Core**

| Signal Name | Direction | Description |
|---|---|---|
| txp_out[N:0] | Out | Positive differential serial data output<br>N = (Lanes – 1) |
| txn_out[N:0] | Out | Negative differential serial data output<br>N = (Lanes – 1) |

## Transceiver Interface Ports – RX

The transceiver ports available on the delivered core component depend on the Shared Logic selection when customizing the core; see Table 2-6 or Table 2-7.

*Table 2-6:* **Transceiver Interface Ports – Shared Logic in Example Design**

| Signal Name | Direction | Description |
|---|---|---|
| gt*N*_rxdata[31:0] | Out | RX data from transceiver. *N* = 0 ... [Lanes – 1] |
| gt*N*_rxcharisk[3:0] | Out | RX Char is K from transceiver. *N* = 0 ... [Lanes – 1] |
| gt*N*_rxdisperr[3:0] | Out | RX disparity error from transceiver. *N* = 0 ... [Lanes – 1] |
| gt*N*_rxnotintable[3:0] | Out | RX Not In Table from transceiver. *N* = 0 ... [Lanes – 1] |

*Table 2-7:* **RX Core: Transceiver Interface Ports – Shared Logic in Core**

| Signal Name | Direction | Description |
|---|---|---|
| rxp_in[N:0] | In | Positive differential serial data input<br>N = (Lanes – 1) |
| rxn_in[N:0] | In | Negative differential serial data input<br>N = (Lanes – 1) |

## Transceiver Debug Interface

**IMPORTANT:** *The ports in the Transceiver Control and Status Interface must be driven in accordance with the appropriate GT user guide. Using the input signals listed in Table 2-8 and Table 2-9 might result in unpredictable behavior of the IP core.*

The transceiver debug interface (when present) provides access to transceiver control and status pins for debug purposes. See the appropriate transceiver user guide (*UltraScale*

*Architecture GTH Transceivers User Guide* (UG576) [Ref 10], *7 Series FPGAs GTX/GTH Transceivers User Guide* (UG476) [Ref 11], or *7 Series FPGAs GTP Transceivers User Guide* (UG482) [Ref 12]) for a detailed description of these pins.

*Table 2-8:* **Optional Transceiver Debug Ports (7 Series Devices)**

| Signal Name[1][2] | Direction | Clock Domain | Description |
|---|---|---|---|
| gtN_drpaddr[8:0] | In | drp_clk | DRP Address Bus |
| gtN_drpdi[15:0] | In | drp_clk | Data bus for writing configuration data from the FPGA logic resources to the transceiver. |
| gtN_drpen | In | drp_clk | DRP Enable Signal<br>0 = No read or write operation performed<br>1 = Enables a read or write operation |
| gtN_drpwe | In | drp_clk | DRP Write Enable<br>0: = Read operation when DEN is 1<br>1 = Write operation when DEN is 1 |
| gtN_drpdo[15:0] | Out | drp_clk | Data bus for reading configuration data from the GTX/GTH transceiver to the FPGA logic resources. |
| gtN_drprdy | Out | drp_clk | Indicates operation is complete for write operations and data is valid for read operations. |
| gtN_loopback[2:0] | In | Async | Transceiver loopback:<br>• 000 = No loopback<br>• 001 = Near-end PCS Loopback<br>• 010 = Near-end PMA Loopback<br>• 100 = Far-end PMA Loopback<br>• 110 = Far-end PCS Loopback<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_txpostcursor[4:0] | In | tx_core_clock | Transmit Differential Driver control. (TX only)<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_txprecursor[4:0] | In | tx_core_clock | Transmit Differential Driver control. (TX only)<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_txdiffctrl[3:0] | In | Async | Transmit Differential Driver control. (TX only)<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_txpolarity | In | tx_core_clock | Transmit polarity control. (TX only)<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_rxpolarity | In | rx_core_clock | Receive polarity control. (RX only)<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_cplllock_out | Out | Async | Active-High signal indicating that the channel PLL has locked to the input reference clock. |
| gtN_eyescandataerror_out | Out | Async | Asserted when an EYESCAN error occurs. |

*Table 2-8:* **Optional Transceiver Debug Ports (7 Series Devices)** *(Cont'd)*

| Signal Name[1][2] | Direction | Clock Domain | Description |
|---|---|---|---|
| gtN_eyescanreset_in | In | Async | This port is pulsed High to initiate the EYESCAN reset process. |
| gtN_eyescantrigger_in | In | rx_core_clock | A High on this port causes an EYESCAN trigger event. |
| gtN_rxbufreset_in | In | Async | This port is driven High and then deasserted to start the RX elastic buffer reset process. |
| gtN_rxbufstatus_out[2:0] | Out | rx_core_clock | RX Elastic Buffer Status |
| gtN_rxbyteisaligned_out | Out | rx_core_clock | RX Byte Alignment Status |
| gtN_rxbyterealign_out | Out | rx_core_clock | RX Byte Alignment has changed. |
| gtN_rxcdrhold_in | In | Async | Hold the CDR control loop frozen. |
| gtN_rxcommadet_out | Out | rx_core_clock | RX Comma detect out |
| gtN_rxdfelpmreset_in | In | Async | DFE reset |
| gtN_rxlpmen_in | In | Async | LPM mode enable |
| gtN_rxmonitorout_out | Out | Async | RX Monitor Out |
| gtN_rxmonitorsel_in | In | Async | RX Monitor Out mode select |
| gtN_rxpcsreset_in | In | Async | PCS Reset |
| gtN_rxpd_in[1:0] | In | Async | RX Power Down<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_rxpmareset_in | In | Async | PMA Reset |
| gtN_rxprbscntreset_in | In | rx_core_clock | RX PRBS Counter Reset |
| gtN_rxprbserr_out | Out | rx_core_clock | RX PRBS Error Detect |
| gtN_rxprbssel_in | In | rx_core_clock | RX PRBS Select |
| gtN_rxresetdone_out | Out | rx_core_clock | RX Reset Done |
| gtN_rxstatus_out[2:0] | Out | rx_core_clock | Encodes RX status and error codes |
| gtN_txbufstatus_out[1:0] | Out | tx_core_clock | TX Elastic Buffer Status |
| gtN_txpcsreset_in | In | Async | TX PCS Reset |
| gtN_txinhibit | In | tx_core_clock | TX Inhibit |
| gtN_txpd_in | In | tx_core_clock | TX Power Down<br>*Note:* Not present when AXI4-Lite Management Interface is enabled. |
| gtN_txpmareset_in | In | Async | TX PMA Reset |
| gtN_txprbsforceerr_in | In | tx_core_clock | TX PRBS Force Error |
| gtN_txresetdone_out | Out | tx_core_clock | TX Reset Done |
| gtN_rxlpmhfhold_in | In | rx_core_clock | (GTP Only) LPM Mode Control |
| gtN_rxlpmhfoverden_in | In | rx_core_clock | (GTP Only) LPM Mode Control |

*Table 2-8:* **Optional Transceiver Debug Ports (7 Series Devices)** *(Cont'd)*

| Signal Name[1][2] | Direction | Clock Domain | Description |
|---|---|---|---|
| gtN_rxlpmlfhold_in | In | rx_core_clock | (GTP Only) LPM Mode Control |

**Notes:**

1. N is the number of the transceiver channels.
2. If you are migrating from a 7 series to an UltraScale architecture-based device, the prefixes of the optional transceiver debug ports for single-lane cores are changed from `gt0`, `gt1` to `gt`, and the postfix `_in` and `_out` are dropped. For multi-lane cores, the prefixes of the optional transceiver debug ports `gt(n)` are aggregated into a single port (see Table 2-9).

*Table 2-9:* **Optional Transceiver Debug Ports (UltraScale Architecture-Based Devices)**

| Signal Name[1] | Direction | Clock Domain | Description |
|---|---|---|---|
| gtN_drpaddr [9:0] | In | drp_clk | DRP Address Bus<br>**Note:** Not present when AXI4-Lite Management Interface is enabled.<br>**Note:** GTH=[8:0], GTY=[9:0] |
| gtN_drpdi [15:0] | In | drp_clk | Data bus for writing configuration data from the FPGA logic resources to the transceiver.<br>**Note:** Not present when AXI4-Lite Management Interface is enabled. |
| gtN_drpen | In | drp_clk | DRP Enable Signal<br>0 = No read or write operation performed<br>1 = Enables a read or write operation<br>**Note:** Not present when AXI4-Lite Management Interface is enabled. |
| gtN_drpwe | In | drp_clk | DRP Write Enable<br>0 = Read operation when DEN is 1<br>1 = Write operation when DEN is 1<br>**Note:** Not present when AXI4-Lite Management Interface is enabled. |

**Notes:**
1. N is the number of the transceiver channels.

# Register Space

The JESD204 PHY core is configured using an AXI4-Lite Register Interface. The register map is shown in Table 2-10.

*Table 2-10:* **PHY Address Register Map**

| Offset | Register Name | Access Type |
|---|---|---|
| 0x000 | Version (0x000) | R |
| 0x004 | IP Configuration (0x004) | R |

*Table 2-13:* **Number of Common Interfaces (0x008)**

| Bits | Default Value | Description |
|---|---|---|
| 31:0 | – | Reading this register returns the number of GT_COMMON blocks in the core. Normally one common block is included per four transceivers.<br>See the following documents for details:<br>◦ *UltraScale Architecture GTH Transceivers User Guide* (UG576) [Ref 10]<br>◦ *7 Series FPGAs GTX/GTH Transceivers User Guide* (UG476) [Ref 11]<br>◦ UltraScale Architecture GTY Transceiver User Guide (UG578) [Ref 18]<br>The number returned here can be used by software to loop round the correct number of times to configure all the QPLLs in the core using the Common DRP control mailbox and the Common PLL control registers.<br>The valid range for the "Common interface select" register cmm_interface_sel (0x020), used to choose which Common PLL is being accessed, is 0 to N-1 where N is the value contained in this register. |

*Table 2-14:* **Number of Transceiver Interfaces (0x00C)**

| Bits | Default Value | Description |
|---|---|---|
| 31:0 | – | Reading this register returns the number of GT_CHANNEL blocks (same as the number of lanes). The number returned here can be used by software to loop round the correct number of times to configure all the transceivers in the core using the Transceiver DRP control mailbox and the Transceiver control register banks.<br>The valid range for the "Transceiver interface select" register gt_interface_sel (0x024), used to choose which transceiver is being accessed, is 0 to N-1 where N is the value contained in this register. |

*Table 2-15:*    **Timeout Enable (0x014)**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:1 | – | Reserved |
| 0 | 1 | Enable the AXI4-Lite timeout. This ensures that transactions to the transceiver registers do not lock the AXI4-Lite bus which can happen if the transceiver is in reset or not being clocked when an access is attempted for example.<br>If a timeout occurs during an AXI transaction, it is indicated on the bresp bus as a SLVERR response, allowing the firmware to act accordingly. |

*Table 2-16:*    **Timeout Value (0x01C)**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:12 | – | Reserved |
| 11:0 | 128 | Set the number of AXI clock cycles to wait before terminating the AXI4-Lite access without completing.<br>If using timeout, the value must be modified according to the relationship between the AXI and DRP clock. The IP handles the DRP access by stretching the AXI interface response until it is completed. If the DRP clock is much slower than the AXI clock, this results in an unintentional timeout of the value is not increased. The timeout counts up so this value should be programmed with 4096-timeout.<br>The complete timeout length is this value + 2 cycles. Valid timeout value are 0 to 4094. Care must be taken to not set to small a value. Base setting this value on the slowest clock of the set, rx_core_clk, tx_core_clk, and drpclk. |

*Table 2-17:*    **cmm_interface_sel (0x020)**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:2 | – | Reserved |
| 1:0 | – | Set the number corresponding to the Common DRP control mailbox or the Common PLL control registers to be accessed. The range is 0 to N-1, where N is the value returned from the Number of Common Interfaces register (0x008). |

*Table 2-18:*    **gt_interface_sel (0x024)**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:2 | – | Reserved |
| 1:0 | – | Set the number corresponding to the Transceiver DRP control mailbox or the Transceiver control register bank to be accessed. The range is 0 to N-1, where N is the value returned from the Number of Transceiver Interfaces register (0x00C). |

*Table 2-19:*    **PLL Status (0x080)**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:5 | – | Reserved |
| 4 | – | Returns 1 when a transmit reset is in progress. |

*Table 2-19:* **PLL Status (0x080)** *(Cont'd)*

| Bits | Default Value | Description |
|------|---------------|-------------|
| 3 | – | Returns 1 when a receive reset is in progress. |
| 2 | – | Returns 0 when all the CPLLs are locked. |
| 1 | – | Returns 0 when all the QPLLs (7 series) or QPLL0s (UltraScale) are locked. |
| 0 | – | Returns 0 when all the QPLL1s are locked (UltraScale only, always returns 0 for 7 series devices). |

**Notes:**

1. Reading all 0 means the core is ready.

# Common/Transceiver DRP Control

The DRP interface provides a "mailbox" mechanism for read/write to multiple DRPs. Bits[31:30] of the DRP Address are used to auto-initiate a read or write of the DRP interface. A Status register is provided to allow you to check the access has completed without error. There are two mailboxes, one at 0x1XX for the COMMON DRPs and one at 0x2XX for the transceiver DRPs.

For accesses to the Common DRP mailboxes, ensure that register cmm_interface_sel (0x020) is programmed with index of the Common DRP that is required. The range is 0 to N-1, where N is the value returned in the "Number of Common interfaces" register (0x008).

For accesses to the Transceiver DRP mailboxes, ensure that register gt_interface_sel (0x024) is programmed with the index of the Transceiver DRP that is required. The range is 0 to M-1, where M is the value returned in the "Number of Transceiver interfaces" register (0x00C).

*Table 2-20:* **Common (0x104)/Transceiver (0x204) DRP Address**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31 | – | Set to 1 to perform a write to the DRP. |
| 30 | – | Set to 1 to perform a read from the DRP. |
| 29:0 | – | DRP register address (See *UltraScale Architecture GTH Transceivers User Guide* (UG576) [Ref 10] or *7 Series FPGAs GTX/GTH Transceivers User Guide* (UG476) [Ref 11] for a complete DRP address map). |

**Notes:**
1. The lower Bits[29:0] can be read/written without triggering a DRP access allowing the firmware to test the address value if required. If both upper bits are set the access is ignored as DRP cannot be read/written at the same time. This will result in 0x0 being read in these upper two bits.

*Table 2-21:* **Common (0x108)/Transceiver (0x208) DRP Write Data**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:16 | – | Reserved, the DRP registers are all 16 bits |
| 15:0 | – | Data to be written to the selected DRP register |

*Table 2-22:* **Common (0x10C)/Transceiver (0x20C) DRP Read Data**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:16 | – | Reserved, the DRP registers are all 16 bits |
| 15:0 | – | Data read back from the selected DRP register |

*Table 2-23:* **Common (0x110)/Transceiver (0x210) DRP Reset**

| Bits | Default Value | Description |
| --- | --- | --- |
| 31:1 | – | Reserved |
| 0 | 0 | Write a 1 to reset the DRP interface. Self-clearing. UltraScale only. |

*Table 2-24:* **Common (0x114)/Transceiver (0x214) DRP Access Status**

| Bits | Default Value | Description |
|------|---------------|-------------|
| 31:3 | – | Reserved |
| 2 | – | Access Type<br>0 = read<br>1 = write<br>This register is only set when "DRP Access in Progress" bit is set to allow a read of all zeros check of the register for completion. Sticky on Timeout Error, updated on new DRP access. |
| 1 | – | Reserved |
| 0 | – | DRP Access in Progress<br>Set on a write of 1 to either of the top two bits of DRP Address register and auto cleared when DRP data is valid. |

*Table 2-25:* **Common (0x11C)/Transceiver (0x21C) DRP Access Complete**

| Bits | Default Value | Description |
|------|---------------|-------------|
| 31:1 | – | Reserved |
| 0 | – | When asset to 1, the AXI4-Lite does not complete the final write to the DRP Address register until the DRP access has completed. When set, there is no need to poll the DRP Access in Progress bit of the DRP Access Status register. |

## DRP Access Sequence Example

Both the number of transceivers and common block present are held in the Configuration register bank and can be used as maximum values in the configuration loops, saving firmware regeneration.

As an example, to program each COMMON PLL block:

1.  Read how many COMMON blocks exist in the system (`num_com` = AXI read 0x8).

2.  Loop over each COMMON `i = 0; i < num_com; i++`.

3.  Set the Common Interface number to access (0 to (`num_com` – 1)) (AXI Write i to 0x020). To write to the DRP:

    a.  Program the value to write over the DRP interface (AXI Write <value> 0x108).

    b.  Program the DRP address value also setting the write flag

4.  To set the write flag, OR the address with 0x8000_0000 (AXI Write (<address> | 0x8000_0000) to 0x104). To read from the DRP,

    a.  Program the DRP address value and also set the read flag.

5.  To set the read flag, OR the address with 0x4000_0000 (AXI Write (<address> | 0x4000_0000) to 0x104).

## Common QPLL Control

For accesses to the Common QPLL Control registers ensure that register cmm_interface_sel (0x020) is programmed with index of the Common QPLL that is required. The range is 0 to N-1, where N is the value returned in the "Number of Common interfaces" register (0x008).

*Table 2-26:* **QPLL0 Power Down (0x304)**

| Bits | Default Value | Description |
|------|---------------|-------------|
| 0 | 0 | 1 = Power Down QPLL (7 series) QPLL0 (UltraScale) |

*Table 2-27:* **QPLL1 Power Down (UltraScale Only) (0x308)**

| Bits | Default Value | Description |
|------|---------------|-------------|
| 0 | 0 | 1 = Power Down QPLL1 (UltraScale Only) |

## Transceiver Control

The following controls are split into three banks internally to minimize the clock domain crossings required for each interface. This does require three separate writes to the select registers. The AXI read/write manages the clock domain crossing, with the result that the AXI accesses are longer than standard.

For accesses to the Transceiver register banks 1 to 3, ensure that register gt_interface_sel (0x024) is programmed with the index of the Transceiver that is required. The range is 0 to M-1, where M is the value returned in the "Number of Transceiver interfaces" register (0x00C).

# Line Rate Switching

The recommended sequence for line rate switching is as follows:[1]

- Ensure all valid data has been sent/received

- Power down the PLL (optional)

- Modify the PLL dividers through the appropriate DRP interface

- Select the correct `refclk` source for each transceiver in RX and TX

- Note if only using one direction the other can be powered down

- Adjust any other control signals

- Power up the PLLs (can be optional)

- Reset the PLL

## DRP Mailboxes

The DRP mailbox interface gives complete access to the common and transceiver DRP address maps as given in the following:

- Ultrascale GTH *UltraScale Architecture GTH Transceivers User Guide* (UG576) [Ref 10]

- *7 Series FPGAs GTX/GTH Transceivers User Guide* (UG476) [Ref 11]

- *UltraScale Architecture GTY Transceivers User Guide* (UG578) [Ref 18]

Xilinx recommends to reference the appropriate user guide, along with the data sheet for minimum/maximum `refclk` frequencies, line rates, etc. for the correct speed/package combination as well as consideration of system supply voltage.

The following sections highlight the registers of interest in the DRP register space when line rate switching. In general, the DRP registers are tightly packed and read modify write sequences should be used to modify the required bits.

---

1. For Virtex 7 GTHE2 devices it is recommended to generate the IP with the lowest line rate frequency that will be used on either the Tx or Rx side. This is because the Transceiver IP generates a PMA reset state machine when the clock dividers are not equal to 1.

# UltraScale Devices DRP Registers

Three PLLs are available in UltraScale devices:

- QPLL0

- QPLL1

- CPLL

## Outclk Dividers

Table 2-42 is applicable to both PLL types.

*Table 2-42:* **DRP Address Map**

| DRP Addr (Hex) | DRP Bits | R/W | Attribute Name | Bits | Encoding | DRP Encoding | Notes |
|---|---|---|---|---|---|---|---|
| 007C | 10:8 | R/W | TXOUT_DIV | 2:0 | 1 | 0 | |
| | | | | | 2 | 1 | |
| | | | | | 4 | 2 | |

## QPLL0/1

The QPLL VCOs have different operating bands, see the device specific data sheet for more information.

- **QPLL0** – 9.8 to 16.3 GHz

- **QPLL1** – 8.0 to 13.0 GHz

The frequency out of the PLL is given by,

$F(pllClkOut) = F(pllClkIn) \times (N / M \times 2)$

Where $N$ = QPLL(0/1)_FBDIV and $M$ = QPLL(0/1)_REFCLK_DIV.

www.xilinx.com

Send Feedback

To calculate the line rate use,

$$F(linerate) = F(pllClkOut) \times 2 / D$$

Where $D = (R/T)XOUT\_DIV$.

*Table 2-43:* **Valid Divider Settings**

| Factor | Attribute | Valid Settings |

## CPLL

The CPLL operating limits for each transceiver type are 2.0 to 6.25 GHz.

The frequency out of the PLL is given by:

$$F(pllClkOut) = F(pllClkIn) \times (N1 \times N2 / M)$$

Where N = QPLL(0/1)_FBDIV and M = QPLL(0/1)_REFCLK_DIV.

To calculate the line rate use:

$$F(linerate) = F(pllClkOut) \times 2 / D$$

Where D = (R/T)XOUT_DIV.

*Table 2-45:* **Valid Divider Settings**

| Factor | Attribute | Valid Settings |
|---|---|---|
| M | CPLL_REFCLK_DIV | 1, 2 |
| N2 | CPLL_FBDIV | 1, 2, 3, 4, 5 |
| N1 | CPLL_FBDIV_45 | 4, 5 |
| D | RXOUT_DIV TXOUT_DIV | 1, 2, 4, 8 |

Table 2-46 shows the addresses of interest as well as the bits and encoding that must be used to select the correct divider values when interpreting the register content.

## *QPLL*

The QPLL VCO operates within two different operating bands, see the device specific data sheet for more information. Note that if switching between these bands, Bit[6] in the QPLL_CFG register must be modified to select the correct band.

- **GTX Lower** – 5.93 to 8.0 GHz
- **GTX Upper** – 9.8 to 12.5 GHz
- **GTH** – 8.0 to 13.1 GHz

The frequency out of the PLL is given by,

$$F(pllClkOut) = F(pllClkIn) \times (N / M \times 2)$$

Where N = QPLL(0/1)_FBDIV and M = QPLL(0/1)_REFCLK_DIV.

To calculate the line rate use,

$$F(linerate) = F(pllClkOut) \times 2 / D$$

Where D = (R/T)XOUT_DIV.

*Table 2-48:* **Valid Divider Settings**

| Factor | Attribute | Valid Settings |
|---|---|---|
| M | QPLL_REFCLK_DIV | 1, 2, 3, 4 |
| N | QPLL_FBDIV QPLL_FBDIV_RATIO | 16, 20, 32, 40, 64, 66*, 80, 100 |
| D | RXOUT_DIV TXOUT_DIV | 1, 2, 4, 8, 16 |

Send Feedback

Table 2-49 shows the addresses of interest as well as the bits and encoding that must be used to select the correct divider values when interpreting the register content.

*Table 2-49:* **DRP Address Map**

| DRP Addr (Hex) | DRP Bits | R/W | Attribute Name | Bits | Encoding | DRP Encoding | Notes |
|---|---|---|---|---|---|---|---|
| 0032 | 15:0 | R/W | QPLL_CFG | 15:0 | 0 to 65535 | 0 to 65535 | Reserved. This attribute is the configuration setting for the QPLL. QPLL_CFG[6] selects the QPLL frequency band. 0 = Upper band 1 = Lower band The recommended value from the 7 series FPGAs Transceivers Wizard should be used. |

| 0036 | 9:0 | R/W | QPLL_FBDIV | 9:0 | 0 to 1023 | 0 to 1023 | Supported divider values (16,20,32,40,64,66,80,100) |
| 0037 | 6 | R/W | QPLL_FBDIV_RATIO | 0 | 0 to 1 | 0 to 1 | *Set to 1 for all N values apart from N = 66, then set to 0 |

## CPLL

The CPLL operating limits are shown for each transceiver type.

- **GTX** – 1.6 to 3.3 GHz
- **GTH** – 1.6 to 5.16 GHz

The frequency out of the PLL is given by,

$$F(pllClkOut) = F(pllClkIn) \times (N1 \times N2 / M)$$

Where N = QPLL(0/1)_FBDIV and M = QPLL(0/1)_REFCLK_DIV.

To calculate the line rate use,

$$F(linerate) = F(pllClkOut) \times 2 / D$$

Where D = (R/T)XOUT_DIV.

*Table 2-50:*    **Valid Divider Settings**

# Designing with the Core

This chapter includes guidelines and additional information to facilitate designing with the core. The JESD204 PHY core can be used in two modes:

- The JESD204 PHY core is instantiated automatically by the JESD204 core during generation. This is transparent, and all ports and parameters are controlled by the JESD204 IP. Using the IP in this mode requires no user intervention and is not described in this document; see the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2] for details about this mode. This mode is fully supported for production systems except in UltraScale™ devices.

- The JESD204 PHY core is instantiated in the example design provided with the JESD204 IP as a stand-alone IP core. In this case, the JESD204 PHY IP top level is available directly for instantiation in designs, and the JESD204 PHY IP GUI is available. This chapter describes using the JESD204 PHY in this mode.

## JESD204 PHY Configuration Options

The JESD204 PHY can be generated in six main logical configurations.

*Table 3-1:* **JESD204 PHY Configuration Options**

| AXI Enabled | Shared Logic | Transceiver Debug | Description |
|---|---|---|---|
| 0 | 0 | 0 | No AXI logic present, no COMMON. |
| 0 | 0 | 1 | No AXI logic present, no COMMON, current JESD204 transceiver ports list. |
| 0 | 1 | 0 | No AXI logic present, COMMON in core. |
| 0 | 1 | 1 | No AXI logic present, COMMON in core, current JESD204 transceiver ports list. |
| 1 | 0 | 0 | AXI logic present, no COMMON or COMMON AXI control registers. |
| 1 | 0 | 1 | AXI logic present, no COMMON or COMMON AXI control registers, transceiver debug ports are minus ports mapped to AXI control. |
| 1 | 1 | 0 | AXI logic present, COMMON in core. |
| 1 | 1 | 1 | AXI logic present, COMMON in core, transceiver debug ports are minus ports mapped to AXI control. |

The common PLL DRP interface is not presented at the JESD204 PHY core output ports under any circumstance and can only be accessed with the AXI interface enabled and a QPLL selected as a `refclk` source.

In UltraScale devices, when the AXI interface is enabled and QPLL0/1 is selected as one of the PLLs, both PLL `refclk` ports appear. This is different to non-AXI mode where only the `refclk` of the selected PLL appears. This is to maximize flexibility when using the AXI interface for line rate switching.

**IMPORTANT:** *When used as a sub-core of the JESD204 core, AXI is disabled by default and cannot be enabled. You must use the JESD204 core with* **Shared Logic in Example Design** *and a separate JESD204 PHY to get access to the AXI JESD204 PHY interface.*

# General Design Guidelines

This section includes tips about getting started with the JESD204 PHY core.

## Use the Example Design as a Starting Point

Each instance of the JESD204 PHY core created by the Vivado® Design Suite is delivered with an example design that can be implemented in an FPGA and simulated. This design can be used as a starting point for your own design or can be used to troubleshoot your application, if necessary.

See Chapter 5, Example Design for information about using and customizing the example designs for the JESD204 PHY core. For more information on the Vivado IP integrator, see the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2].

## Degree of Difficulty

JESD204 designs are challenging to implement in any technology, and the degree of difficulty is further influenced by:

- Maximum system clock frequency

- Targeted device architecture

- Nature of your application

All JESD204 implementations require careful attention to system performance requirements. Pipelining, logic mapping, placement constraints, and logic duplication are all methods that help boost system performance.

# Clocking

This section describes the options available for clocking the JESD204 PHY core and the transceiver(s). The following clocks are used in the JESD204 PHY core.

- **DRP Clock** – The transceiver requires an auxiliary clock for internal use and also for the reset state machines within the JESD204 PHY core. See the appropriate device family data sheet for the min and max DRP clock frequencies permitted.

- **Core Clock** – The JESD204 PHY core operates using a 32-bit (4-byte) datapath. The device clock for the core logic therefore runs at one quarter of the byte clock rate (1/$40^{th}$ of the serial line rate). For the JESD204 and JESD204 PHY cores, this is referred to as the core clock.

- **Reference Clock** – The GTP/GTX/GTH serial transceivers require a stable, low-jitter reference clock that has a device and speed grade dependant range. In some circumstances, the same source clock can supply both the reference clock and core clock. Two reference clocks are required if both CPLL and QPLL (GTX/GTH devices) or PLL0 and PLL1 (GTP devices) are selected in the GUI.

- **AXI4-Lite Configuration Interface Clock** – Required if the AXI is enabled. This is asynchronous to any other clock and can be driven by the processor subsystem.

# Resets

There are two system resets (tx_sys_reset and rx_sys_reset) and two data path resets (tx_reset_gt and rx_reset_gt).

These enable the JESD204 PHY core to be used by a transmit JESD204 link and a receive JESD204 link independently.

- **Transmit Reset** – The transmit reset input (`tx_reset_gt`) initiates a data path reset sequence for the transmit logic data path, and `tx_reset_done` is asserted when the reset sequence is complete. The tx_sys_reset input initiates a complete data path and PLL reset sequence and asserts tx_reset_done when complete.

- **Receive Reset** – The receive reset input (`rx_reset_gt`) initiates a data path reset sequence for the receive logic data path, and `rx_reset_done` is asserted when the reset sequence is complete. The rx_sys_reset input initiates a complete data path and PLL reset sequence and asserts rx_reset_done when complete.

Figure 3-1 shows 7 Series GT Reset Control.

*Figure 3-1:* **7 Series GT Reset Control**

www.xilinx.com

Figure 3-2 shows UltraScale GT Reset Control.

*Figure 3-2:* **UltraScale GT Reset Control**

# Protocol Description

See the *JESD204 LogiCORE IP Product Guide* (PG066) for a full description of the protocol [Ref 2].

# Design Flow Steps

This chapter describes customizing and generating the core, constraining the core, and the simulation, synthesis and implementation steps that are specific to this IP core. More detailed information about the standard Vivado® design flows can be found in the following Vivado Design Suite user guides:

- *Vivado Design Suite User Guide: Designing with IP* (UG896) [Ref 3]

- *Vivado Design Suite User Guide: Getting Started* (UG910) [Ref 5]

- *Vivado Design Suite User Guide: Logic Simulation* (UG900) [Ref 6]

## Customizing and Generating the Core

This section includes information about using Xilinx tools to customize and generate the core in the Vivado Design Suite.

You can customize the IP for use in your design by specifying values for the various parameters associated with the IP core using the following steps:

1. Select the IP from the Vivado IP catalog.

2. Double-click the selected IP or select the **Customize IP** command from the toolbar or right-click menu.

For details, see the *Vivado Design Suite User Guide: Designing with IP* (UG896) [Ref 4] and the *Vivado Design Suite User Guide: Getting Started* (UG910) [Ref 5].

***Note:*** Figures in this chapter are illustrations of the Vivado IDE. The layout depicted here might vary from the current version.
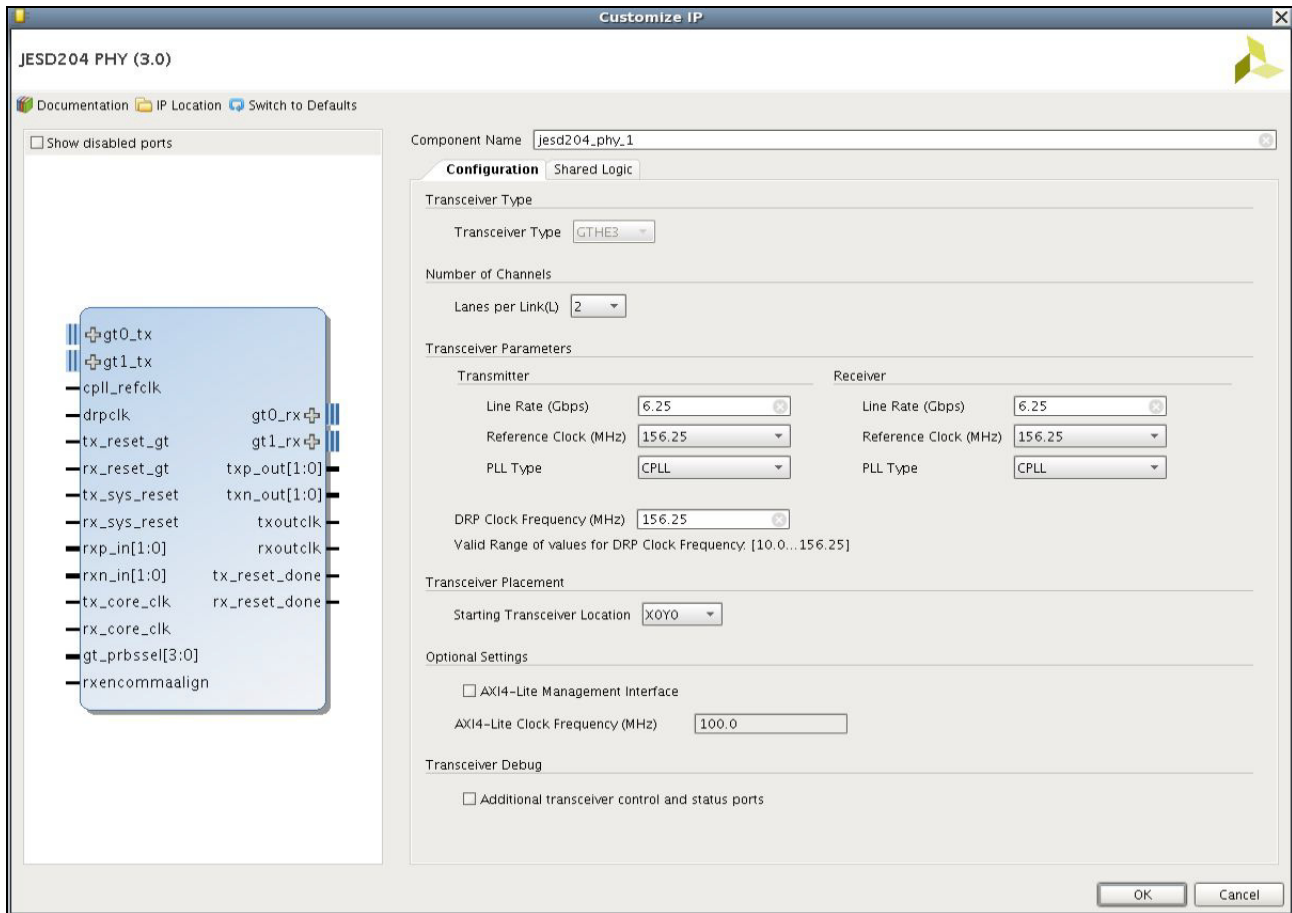

## Configuration Tab

*Figure 4-1:* **Configuration Tab**

- **Transceiver Type (UltraScale only)**

  - **Transceiver Type –** For Devices with GTY transceivers, this option allows the selection of GTH or GTY.

- **Number of Channels (Transceivers)**

  - **Lanes per Link** – The core supports 1 to 12 lanes. The number of transmit lanes always matches the number of receive lanes. For asymmetric interfaces, multiple cores can be generated and multiple PHY cores can be connected to a single JESD204 core.

- **Transceiver Parameters, Transmitter, and Receiver**

  - **Line Rate** – The serial line rate in Gb/s can be selected for transmit and receive independently. The minimum rate is 1 Gb/s and the maximum depends on the chosen device and speed grade.

  - **Reference Clock** – The reference clock must be selected from the drop-down list, which presents a list of valid reference clock frequencies for the selected line rate.

Independent reference clocks can only be selected if different PLLs are selected for transmit and receive.

- ◦ **PLL Type** – Select the QPLL or CPLL for transmit and receive. See the appropriate device transceiver user guide for more details and limitations.

- ◦ **DRP Clock Frequency** – The frequency of the DRP clock being applied to the core so reset delays can be adjusted by the reset state machines.

- **Transceiver Placement (UltraScale only)**

  - ◦ **Starting Transceiver Location** – Select starting location of lane 0. This allows Vivado to generate the correct location constraints for the transceiver during IP generation.

- **Optional Settings**

  - ◦ **AXI4-Lite Management Interface** – Select to include the AXI4-Lite configurations interface. This allows AXI-based access to the Transceiver and Common DRPs along with a selection of transceiver pins that allow line rate switching in the core.

  - ◦ **AXI4-Lite Clock Frequency** – The AXI4-Lite clock can be connected to the main processor clock. When applicable, the clock domain boundary crossings are handled inside the IP to simplify implementation. Also, when a clock boundary is involved the AXI access is stretched, resulting in an extended access time.

  - ◦ **Extend reset to 3 ms (7-Series only) –** Increases reset duration to 3ms in the transceiver logic. When enabled, simulation times are increased.

- **Transceiver Debug** – Select to include additional transceiver control and status ports for debugging purposes. See Transceiver Debug Interface in Chapter 2 for more information.

## Shared Logic Tab

The JESD204 PHY can be generated with Shared Logic (Quad PLL(s)) included in the core or with Shared Logic included with the example design. Shared Logic should always be included in the core when using the JESD204 PHY with a JESD204 IP core.

## User Parameters

Table 4-1 shows the relationship between the GUI fields in the Vivado IDE and the User Parameters (which can be viewed in the Tcl console).

*Table 4-1:*    **Vivado IDE Parameter to User Parameter Relationship**[1]

| Vivado IDE Parameter/Value | User Parameter/Value | Default Value |
|---|---|---|
| Lanes per Link | C_LANES | 2 |
| Line Rate | | |
|    Transmit | GT_Line_Rate | 6.25 |
|    Receive | RX_GT_Line_Rate | 6.25 |
| Reference Clock | | |
|    Transmit | GT_REFCLK_FREQ | 156.25 |
|    Receive | RX_GT_REFCLK_FREQ | 156.25 |
| PLL Type | | |
|    Transmit | C_PLL_SELECTION | 0 (= CPLL) |
|    Receive | RX_PLL_SELECTION | 0 (= CPLL) |
| DRP Clock Frequency | DRPCLK_FREQ | 10.0 |
| Shared Logic | SupportLevel | 1 (= Include Shared Logic in Core) |
| Transceiver Debug | TransceiverControl | FALSE |
| AXI-Lite Interface | AXI_Lite | FALSE |
| Transceiver Type | Transceiver | GTHE3 |
| Starting Transceiver Location | GT_Location | X0Y0 |
| Extend Reset to 3 ms | gt_val_extended_timeout | False |

**Notes:**
1.  Parameters and default values will differ based on the selected device.

## Output Generation

For details, see the *Vivado Design Suite User Guide: Designing with IP* (UG896) [Ref 4].

---

# Constraining the Core

This section describes how to constrain a design containing the JESD204 core. This is accomplished by using the XDC delivered with the core at generation time. An additional XDC file is generated with the IP example design; only the core XDC file should be used in user designs.

# Required Constraints

This section defines the constraint requirements for the core. Constraints are provided in several XDC files which are delivered with the core and the example design to give a starting point for constraints for the user design.

There are four XDC constraint files associated with this core:

- `<corename>_example_design.xdc`

- `<corename>_ooc.xdc`

- `<corename>.xdc`

- `<corename>_clocks.xdc`

The first is used only by the example design; the second file is used for Out Of Context support where this core can be synthesized without any wrappers; the third file is the main XDC file for this core.

## Clock Frequencies

The reference clock and core clock frequency constraints vary depending on the selected line rate and reference clock when generating the core. See the generated XDC for details.

## Clock Domains

There are also several paths where clock domains are crossed. These include the management interface. See the generated XDC file for details.

## Clock Management

Reference clock and core clock resources require location constraints appropriate to your top level design.

## Clock Placement

Reference clock input should be given location constraints appropriate to your top level design and to the placement of the transceivers.

***Note:*** Transceiver location constraints are only required for 7-Series devices.

Core clock input (if required) should be given location constraints appropriate to your top level design.

www.xilinx.com

Send Feedback

## Banking

All ports should be given location constraints appropriate to your top level design within banking limits.

## Transceiver Placement

Transceivers should be given location constraints appropriate to your design. In some cases, example transceiver location constraints can be found in the example design XDC file. For 7 series devices, the GT location constraints are in the transceiver's XDC file.

For UltraScale devices, it is recommended that the location of the transceivers is configured during IP customization. This allows Vivado to generate the correct location constraints.

## I/O Standard and Placement

All ports should be given I/O standard and location constraints appropriate to your top level design.

# Simulation

For comprehensive information about Vivado simulation components, as well as information about using supported third-party tools, see the *Vivado Design Suite User Guide: Logic Simulation* (UG900) [Ref 6].

**IMPORTANT:** *For cores targeting 7 series or Zynq-7000 AP SoC devices, UNIFAST libraries are not supported. Xilinx IP is tested and qualified with UNISIM libraries only.*

# Synthesis and Implementation

For details about synthesis and implementation, see the *Vivado Design Suite User Guide: Designing with IP* (UG896) [Ref 4].

# Example Design

This chapter contains information about the example design provided in the Vivado® Design Suite.

The JESD204 PHY core is not intended to be used as a standalone solution. However, an example design does exist for the IP core. The example design is a lightweight harness that can operate in external TX to RX loopback or as independent RX/TX channel mode. See the example design provided with the JESD204 IP for a more detailed example of the use of the *JESD204 LogiCORE IP Product Guide* (PG066) [Ref 2].

To open the example design, right-click the IP and select **Open IP Example Design** as shown in Figure 5-1.

*Figure 5-1:* **Opening the Example Design**

The example design generates data internally for the TX path. This is checked externally and can also be fed back into the RX path, where a simple check function exists to verify the incoming data is 8'hBC.

The `clks_in` module places the appropriate clock buffers on the clock paths dependent on the technology chosen.

The sequencer is responsible for indicating when the example design can test the incoming data as well as sequencing the data that is transmitted. When both the RX and TX channels are out of reset, it sends out K28.5 symbols. These are followed by four `/R/…./A/` frames mimicking what is seen on a JESD204 data interface. Note `/Q/` and the 14 bytes of `/Q/` data are not sent. They just increment counter values.

Figure 5-2 shows a block diagram for the example design.

*Figure 5-2:* **Example Design Block Diagram**

Figure 5-3 and Figure 5-4 show the clock structure for different and identical PLL types, respectively.

💡 **TIP:** *If different PLLs are selected for the RX and TX paths, the port names for refclk are named as "rx" and "tx." If they are the same, the port is named as "common."*
*Figure 5-3:*    **Clock Structure with Different PLL Types**

*Figure 5-4:* **Clock Structure with Matching PLL Types**

# Test Bench

This chapter contains information about the test bench provided in the Vivado® Design Suite. Figure 6-1 shows the test bench block diagram.

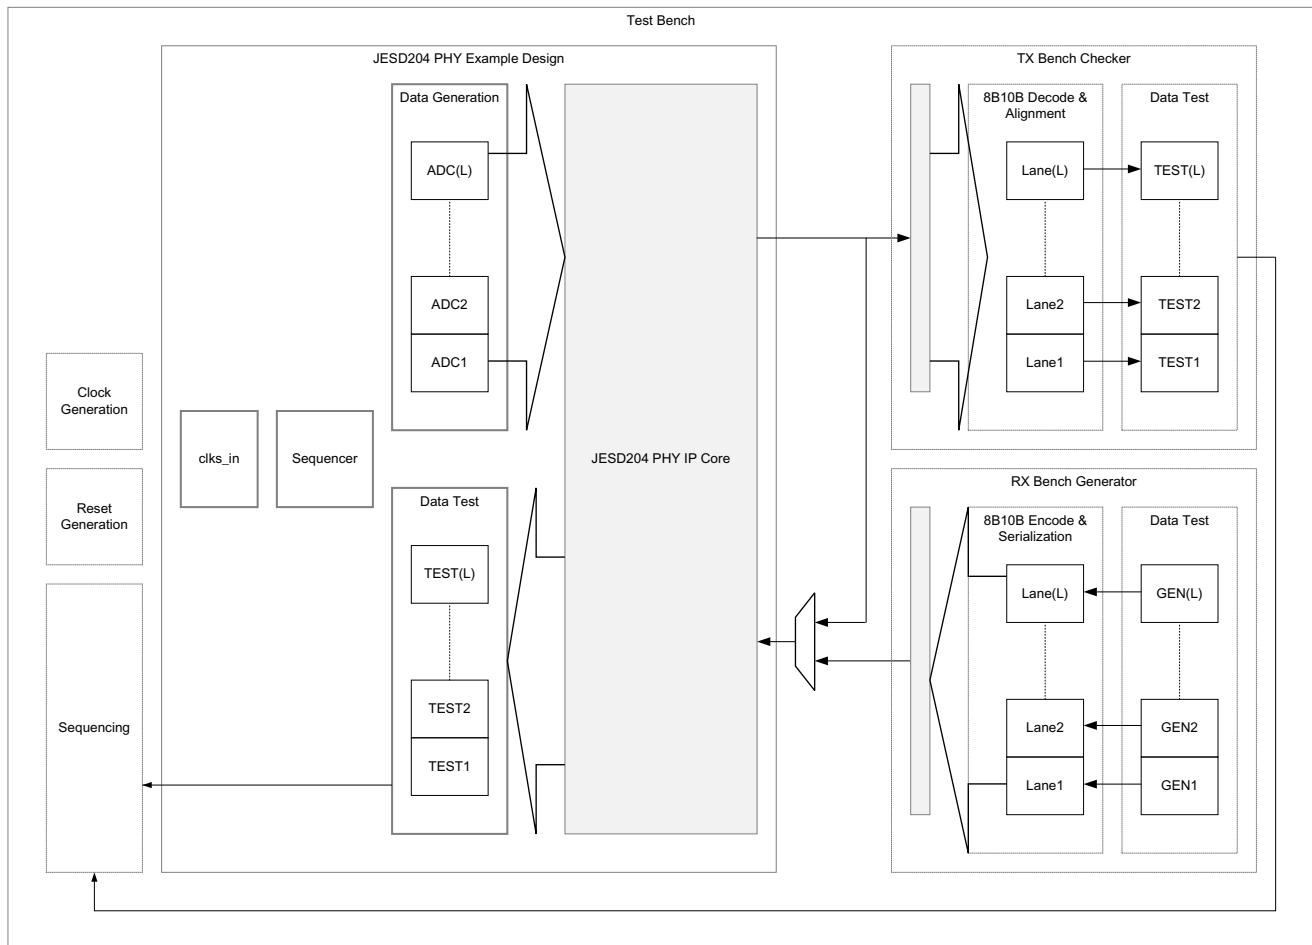

*Figure 6-1:*     **Test Bench Block Diagram**

Hierarchy is used extensively to create per-lane stimulus and checker blocks which allow easier signal viewing in the waveform window.

The test bench provides all clocks required by the design. If the TX and RX line rates are equal, the loopback path is automatically selected for simulation at IP build time.

Several event messaging functions exist at the top-level. These indicate when the lanes are out of reset and the bit rates used by the RX and TX channels. A timeout function is also included.

The data generation and testing functions exist in separate modules instantiated in the top-level test bench. This enables clear navigation to a lane data stream with the waveform viewer. The data stream starts when both the TX and RX paths are out of reset. K28.5 (/K/) symbols are transmitted to allow the transceivers to bit align.

An ILA-type sequence, consisting of just the K28.0 (/R/), K28.3 (/A/) and data, is sent to allow the test bench to align to a 32-bit boundary. The bench continues to run for a specified length of core clock cycles before finishing.

**IMPORTANT:** *To change any IP parameters, you must reconfigure the IP and regenerate the example design.*

# AXI Interface

If the IP is generated with the AXI interface, this is presented in the test bench along with tasks to write/read over the interface. Basic examples are given at the start of the test, however the tasks might be used to test out custom sequences.

For UltraScale devices, see *UltraScale Architecture GTH Transceivers User Guide* (UG576) [Ref 10], *Appendix B* for a detailed DRP register map and for 7 series devices, see *7 Series FPGAs GTX/GTH Transceivers User Guide* (UG476) [Ref 11], *Appendix D.*

# Verification, Compliance, and Interoperability

The JESD204 core has been verified using both simulation and hardware testing.

## Simulation

A highly parameterizable transaction-based simulation test suite has been used to verify the core. Tests include:

- Scrambling and alignment
- Loss and regain of synchronization
- Frame transmission
- Frame reception
- Recovery from error conditions

## Hardware Testing

The core has been used in many hardware test platforms within Xilinx and in interoperability testing with external hardware vendors.

# Debugging

This appendix includes details about resources available on the Xilinx Support website and debugging tools.

## Finding Help on Xilinx.com

To help in the design and debug process when using the JESD204 PHY, the Xilinx Support web page contains key resources such as product documentation, release notes, answer records, information about known issues, and links for obtaining further product support.

### Documentation

This product guide is the main document associated with the JESD204 PHY. This guide, along with documentation related to all products that aid in the design process, can be found on the Xilinx Support web page or by using the Xilinx Documentation Navigator.

Download the Xilinx Documentation Navigator from the Downloads page. For more information about this tool and the features available, open the online help after installation.

### Answer Records

Answer Records include information about commonly encountered problems, helpful information on how to resolve these problems, and any known issues with a Xilinx product. Answer Records are created and maintained daily ensuring that users have access to the most accurate information available.

Answer Records for this core can be located by using the Search Support box on the main Xilinx support web page. To maximize your search results, use proper keywords such as:

- Product name
- Tool message(s)
- Summary of the issue encountered

A filter search is available after results are returned to further target the results.

**Master Answer Record for the JESD204 PHY Core**

AR: 61911

# Technical Support

Xilinx provides technical support at the Xilinx Support web page for this LogiCORE™ IP product when used as described in the product documentation. Xilinx cannot guarantee timing, functionality, or support if you do any of the following:

- Implement the solution in devices that are not defined in the documentation.
- Customize the solution beyond that allowed in the product documentation.
- Change any section of the design labeled DO NOT MODIFY.

To contact Xilinx Technical Support, navigate to the Xilinx Support web page.

# Debug Tools

There are many tools available to address IP core design issues. It is important to know which tools are useful for debugging various situations.

## Vivado Design Suite Debug Feature

Vivado Design Suite debug feature inserts logic analyzer and virtual I/O cores directly into your design. The debug feature also allows you to set trigger conditions to capture application and integrated block port signals in hardware. Captured signals can then be analyzed. This feature in the Vivado IDE is used for logic debugging and validation of a design running in Xilinx devices.

The Vivado logic analyzer is used with the logic debug LogiCORE IP cores, including:

- ILA 2.0 (and later versions)
- VIO 2.0 (and later versions)

See the *Vivado Design Suite User Guide: Programming and Debugging* (UG908) [Ref 8].

## Reference Boards

Various Xilinx development boards support the JESD204 PHY. These boards can be used to prototype designs and establish that the core can communicate with the system.

- 7 series FPGA evaluation boards:
  - AC701
  - KC705
  - ZC706
  - VC709

# Simulation Debug

The simulation debug flow for QuestaSim is illustrated in Figure B-1. A similar approach can be used with other simulators.
SecureIP models are used to simulate the MGTs.
To use these models, a Verilog LRM-IEEE 1364-2005 encryption-compliant simulator is required.

A Verilog license is required to simulate with the SecureIP models. If the user design uses VHDL, a mixed-mode simulation license is required.

If the libraries are not compiled and mapped correctly, it will cause errors such as:
# ** Error: (vopt-19) Failed to access library 'secureip' at "secureip".
# No such file or directory. (errno = ENOENT)
# ** Error: ../../example_design/ xaui_core_block.v(820): Library secureip not found.

To model the MGTs, the SecureIP models are used. These models must be referenced during the vsim call. Also, it is necessary to reference the unisims library.

The example design should allow the user to quickly determine if the simulator is set up correctly; the core achieves SYNC and transmits or receives an ILA sequence.

**Flow diagram:**

QuestaSim Simulation Debug

Check for the latest supported versions of Questa SIM in the Datasheet. Is this version being used? — No → Update to this version.
Yes ↓

If using VHDL, do you have a mixed-mode simulation license? — No → Obtain a mixed-mode simulation license.
Yes ↓

Do you get errors referring to failing to access library? — Yes → Need to compile and map the correct libraries. See the *Vivado Design Suite User Guide - Logic Simulation UG900*
No ↓

Do you get errors indicating "GTP_DUAL" or other elements like "BUFG" not defined? — Yes → For verilog simulations add the "-L" switch with the appropriate library reference to the vsim command line. For example: -L secureip or -L unisims_ver.
No ↓

Does simulating the example design give the expected output? — Yes → See Example Design chapter in this Product Guide.
No ↓

If problem is more design specific, open a case with Xilinx Technical Support and include a wlf file dump of the simulation. For the best results, dump the entire design hierarchy.

*Figure B-1:* **QuestaSim Debug Flow Diagram**

# Hardware Debug

Hardware issues can range from link bring-up to problems seen after hours of testing. This section provides debug steps for common issues. The debug feature is a valuable resource to use in hardware debug. The signal names mentioned in the following individual sections can be probed using the debug feature for debugging the specific problems.

## General Checks

• Ensure that all the timing constraints for the core were met during implementation.

• Ensure that all clock sources are clean and in particular that the transceiver reference clocks meet the GTX/GTH/GTP/GTY transceiver requirements from the appropriate FPGA Data Sheet.

• Ensure that all GTX/GTH/GTP/GTY transceiver PLLs have obtained lock by monitoring the QPLLLOCK_OUT and/or CPLLLOCK_OUT port either using the debug feature or by routing the signals to a spare pin.

• Ensure that when regenerating a new GTX/GTH/GTP/GTY transceiver the reference clock of the new transceiver matches that of the design.

# Revision History

The following table shows the revision history for this document.

| Date | Version | Revision |
|------|---------|----------|
| 11/18/2015 | 3.0 | Added support for UltraScale+ families. |
| 09/30/2015 | 3.0 | • Resource Utilization removed (now online).<br>• Updated Figures 1-1 and 1-2 to add tx/rx_sys_reset signals.<br>• Added support for GTY Transceivers.<br>• Removed registers Common DRP select (0x100) and PLL select (0x300)<br>• Removed registers Transceiver DRP select (0x200), Transceiver Select Bank 1 (0x400), Transceiver Select Bank 2 (0x500), Transceiver Select Bank 3 (0x600)<br>• Added mmcm_lock ports for GTP transceivers |
| 04/01/2015 | 2.0 | • Updated Applications section.<br>• Added GT Port important note in Transceiver Control and Status Ports section.<br>• Updated Table 2-4: Common Clock and Reset Ports.<br>• Added qpll0_reset_out and qpll1_reset_out to Table 2-5: Clocks and Resets for Shared Logic in Example Design.<br>• Added Register Space and Line Rate Switching section.<br>• Added JESD204 PHY Configuration Options section.<br>• Updated Clocking section.<br>• Updated Fig. 4-1: Configuration Tab.<br>• Added Optional Settings in Configuration Tab section.<br>• Updated User Parameters.<br>• Added constraint file in Required Constraints section.<br>• Added UNISIM important note in Simulation section.<br>• Added AXI Interface section in Test Bench chapter. |
| 10/01/2014 | 1.0 | Initial Xilinx release. |
